ANALYSIS OF SOIL (Cultivator).—You will find a simple mode in Johnson's "Science and Practice of Gardening." You can have it free from our office if you enclose forty postage stamps with your address.

NAMES OF FRUITS (G. Ramsey).—The Pear is Bergamotte Cadette, and the Apple Baddow Pippin. (A. B., Bromley).—1, Broughton; 3, Ord's.

NAMES OF PLANTS (—).—*Canavalia ensifolia*. *Chrysanthemum*.—We have received a box of these without any name; but it is of no consequence, for, as we have often said, we cannot name the varieties of florists' flowers. They are in *legions*. (*Nemol*).—1, *Habrothamnus fasciculatus*; 2, *Platyloma rotundifolia*; 3, *Sclaginella Martensii*; 4, *S. Ludoviciana*. (*P. P.*)—*Magnolia glauca*. (*M. R. C. S.*)—Orchid bloom too much crushed to be identified.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending November 24th.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

TRIMMING—MANAGEMENT OF SHOWS.

I cut the leaves of "our Journal" expecting to find a long list of opinions and dissertations on the very important issue raised by "NEMO"—viz., the trimming of fowls for exhibition, and can only account for their non-appearance by the all-absorbing elections. I write in the hope that this question will be taken up by our fanciers at large. My own opinion is, that so long as Judges grant the prizes, &c., to trimmed birds, and leave untrimmed ones out in the cold, trimming will be practised. No doubt, a judge's task is no easy one, and trimming is in many cases almost impossible to detect. Take, however, Brahmas. All breeders know that it is next to impossible to breed birds with very heavily-feathered legs and feet, without their being also hocked, and what I would ask of our judges is, not to pass over a bird shown in its natural state, and give the prizes to those birds whose feathers had been extracted, when the birds are in other respects equal.

If am not trespassing too much on your valuable space, I would like to say a word on the line "A CHESHIRE MAN" alludes to. The fact of the Secretary exhibiting cannot but have a very suspicious appearance in the eyes of other exhibitors, from his attendance on the birds, and knowledge of the judge, and most likely his presence during judging, and it is a practice which I hope will be discountenanced.

Finally, I would like the managers of our leading shows to allow the entry list to remain open for a rather longer period, as it is difficult to know a month beforehand how birds may moult (especially chickens), and which will turn out best.—J. W. C.

BREEDING PILE AND DUCKWING GAME FOWLS.

I omitted the following in the last papers on Piles and Duckwings:—

The usual or favourite colour for the breasts of Pile Game hens at exhibitions and elsewhere, is the "dull chestnut" or "dull clay colour." I do not admire the clay-coloured breasts in Pile hens, and much more admire "white breasts thickly streaked or veined with bright red;" or else hens' breasts marked with the "horseshoe-shaped bright red marks on the white ground;" these horseshoe marks with the round side downwards always, they being the red margins of the rounded lower ends of the hen's breast feathers. Hens with breasts marked in the two ways here described, I think, are very handsome in their pencilling, far more so than any "clay-breasted" Pile hens are, and they also match the "red marble-breasted" Pile cocks much better than the dull clay-breasted hens do, and such Piles as I have described, I consider to be the best-marked Piles.

Our exhibition yellow and willow-legged Piles are all "made up," or cross-bred birds; mongrels, and not pure-bred Pile Game. The pure-bred Piles, bred from Piles with Piles, for some generations, are the old white-legged Red Piles with red eyes, which are the true Pile Game fowls, and not cross-bred birds, and are also our "gamest" Piles. These latter are, however, not quite such high-coloured birds, and, therefore, not so good in colour as our cross-bred exhibition Pile Game fowls.

In like manner our high-coloured yellow exhibition Duckwing Game are all "made-up" birds, and cross-bred birds or mongrels which would not retain their high colour, or transmit it if bred with pure Duckwings, as pure-bred Duckwings will always breed to Greys or Grey Duckwings if crossed with their own colour instead of with Reds, but the crossing with the Reds keeps up the high colour in Duckwing cocks' backs, which, though a sign of impurity of breed, seems to have been made the chief desideratum at our exhibitions. I do not, of course, mean to deny that our exhibition Piles and Duckwing cocks (not hens), are not the handsomest specimens of their colour.

There is also another but an inferior strain of pure-bred Pile Game fowls—the yellow-legged gravel-coloured Piles with yellow eyes, but they are not birds of spirit as compared to the white-legged Piles. Our handsome exhibition Piles are mostly white-tailed White-breasted Reds, scarcely Pied birds at all, as already mentioned.

The best Lemon Piles, yellow legs and eyes, were made from

the "Derby Reds," and from the "Mexborough Yellow Duckwings," crossed with the yellow-legged White Game hens; and at Burton Agnes Park, Boynton, near Bridlington, Yorkshire, Sir Henry Boynton, Bart., had some once-celebrated yellow-backed Blue Dun Game fowls, which also produced good Lemon Piles, but these breeds are now bred out or nearly so. The true Lemon Piles being yellow or daw-eyed, were never such game birds, I believe, as the white-legged, red-eyed Piles were, nor so game as any red-eyed Piles are, but the three above-mentioned strains of Lemon Piles were certainly the best of their colour.

In the twenty-sixth line from the bottom of the second column, page 390, the fourth word from the end of the line should be "in," and not "to."—NEWMARKET.

BRAHMA POOTRAS COMBS, &c.

WHAT is the correct comb for a Brahma cock? This is a question of general interest to all Brahma breeders at the present day, and I, for one, hope you can obtain and publish information on this point from some of our best judges in the Brahma classes. In the "Standard of Excellence," published by the Poultry Club, I see as follows:—"Comb, pea; small, low in front, and firm on the head without falling over to either side, distinctly divided, so as to have the appearance of three small combs joined together in the lower part and back, the largest in the middle, each part slightly and evenly serrated."

Now, of all classes of poultry, the pea-comb is a peculiar and marked character of the Brahma, and, with a little unity on the part of the judges, may undoubtedly be so maintained.

On visiting the Southampton Show, I was much surprised to see how very little regard had been paid to the combs in the class for Light Brahma chickens. Even the bird to which the cup and first prize were awarded had a very large comb, which grew very far back on the head. The second-prize bird's comb was not at all firm; it quite shook when the bird moved its head. Most of the other birds which were noticed had very large combs, and combs that almost formed a spike at the back; while three pens with combs most nearly answering to the description in the "Standard" were passed without any notice, and these were very good birds in other respects, and had all previously been prizetakers. One bird that was highly commended had a large comb, quite lopping over the side of its head. To the casual observer it would appear that the comb was a matter of very little moment, instead of being one of the leading features of the Brahma, and I much fear, if we cannot persuade our judges to give more attention to this point, we shall see ere long the neat head of a Brahma surmounted by a comb that would hardly disgrace a Hamburg.—PETER CROWLEY.

[Either pea or single combs are correct in Brahma Pootras, but the former have always been preferred as a matter of fancy. We have never heard the "Standard of Excellence" considered an authority in poultry matters. We did not visit the Southampton Show, and can, therefore, say nothing about the Brahma judging. We consider the comb a great point in a pen of Brahmas. Whether single or pea, all should be alike, and perfect of their sort. Our idea is that if it were possible to find two pens so precisely alike, that they should differ in nothing but combs, and in that respect, save in shape, should be on an equality, we should allow the pea-comb to weigh in favour of its possessors; but if the pea-combed birds were inferior to the single-combed in other respects, we should not allow them to be the first on account of their combs.]

DUCKS' EGGS DISCOLOURED.

I HAVE been waiting for any explanation that might be given to account for the discoloration of Ducks' eggs, complained of by Captain Horne in your Journal of November 12th. I believe it is caused by their feeding on acorns, and I have heard it attributed to this cause. My Ducks will absent themselves from the yard for weeks while the acorns are abundant, but they soon return for their regular meals when the supply fails.—L. B.

ABERDEEN POULTRY SHOW.—This deserves encouragement from exhibitors. Seven silver cups and three silver medals are in the list of prizes, besides the usual money rewards.

The birds are to be shown in pairs or singly. We regret that Pelands are ignored, and that Coloured Dorkings must be shown in a class that includes the White.

NORTHUMBERLAND ORNITHOLOGICAL SOCIETY'S SHOW.

THIS Exhibition, held on the 18th, 19th, and 20th of November, was very successful, there being upwards of 550 pens of Pigeons, also Canaries and other birds. The Committee offered £90 in prizes. The Corn Exchange, in which the Show was held, proved a most admirable building for a display of the kind, and, large as the number of entries was, no inconvenience was experienced in the arrangement. The attendance of visitors was good.

Among the Pigeons were many excellent birds; and the Canaries were very superior in quality. Mr. Bailey, of Sowerby, near Thirsk, and Mr. Frost, of Newcastle, exhibited some foreign birds which proved a great attraction.

Fanciers of both Canaries and Pigeons were not slow in showing their appreciation of the different classes as very many birds were claimed.

Annexed is a list of the awards:—

POUTERS (Yellow).—Cocks.—First, R. Fulton, Deptford. Second, A. Wright, Morningside, Edinburgh. **Hens.**—First, A. H. Stewart. Second, H. Brown, Walleley, Sheffield. Highly Commended, R. Fulton; G. McKenzie, Llanthead.

POUTERS (Black).—Cocks.—First, A. H. Stewart, Birmingham. Second, R. Fulton. **Hens.**—First and Second, R. Fulton. Very Highly Commended, A. H. Stewart.

POUTERS (Red).—Cocks.—First, S. Robson, Brotherton. Second and Commended, R. Fulton. Highly Commended, J. Bell, Newcastle; A. Wright; A. H. Stewart. **Hens.**—First and Second, R. Fulton. Highly Commended, A. H. Stewart.

POUTERS (Blue).—First, R. Fulton. Second, A. H. Stewart. Highly Commended, R. Fulton; J. Hawley, Bingley; H. Simpson, Shank House. Hens.—First, J. Hawley. Second, R. Fulton. Highly Commended, R. Fulton; H. Simpson; C. Vaux, Sunderland. Commended, J. Grant; M. Sanderson.

POUTERS (White).—Cocks.—First and Very Highly Commended, R. Fulton. Second and Highly Commended, J. Grant, Edinburgh. **Hens.**—First and Second, R. Fulton. Commended, J. Grant.

POUTERS (Any other colour).—Cocks.—First, R. Fulton. Second, M. Sanderson, Edinburgh (Mealy). Highly Commended, R. Fulton; A. H. Stewart (Mealy); F. Key, Beverley (Mealy). **Hens.**—First, M. Sanderson (Splash). Second, E. Brown, Sheffield. Highly Commended, W. Moore, Edinburgh (Chequer); M. Sanderson (Mealy). Commended, F. J. Leach; C. Vaux (White with Black tail).

CARRIERS (Black).—Cocks.—First and Second, R. Fulton. Highly Commended, R. Fulton; T. Colley, Sheffield; W. R. & H. O. Blenkinsop, Newcastle; F. J. Leach, Middlesbrough. **Hens.**—First, R. Fulton. Second, J. Thompson, Wide Open, Newcastle. Highly Commended, R. Fulton; F. J. Leach.

CARRIERS (Any other colour).—Cocks.—First and Second, R. Fulton. Highly Commended, T. Colley; J. C. Ord, London (White and Blue). **Hens.**—First and Second, R. Fulton. Highly Commended, W. R. & H. O. Blenkinsop.

TUMBLERS (Almond and Short-faced).—First, J. Fielding, jun. Second and Very Highly Commended, R. Fulton. Highly Commended, J. Hawley; H. Yardley, Birmingham; F. J. Leach; J. Pringle, Newcastle; C. Vaux. Commended, Baxter & Daniels, Newcastle.

TUMBLERS (Any other colour and Short-faced).—First, R. Fulton. Second, J. Fielding, jun., Rochdale. Highly Commended, W. H. C. Oates, Beesthorpe, Newark (Blue Beard); C. Vaux (Yellow Mottles); Baxter & Daniels (Kites).

TUMBLERS (Almond and Short-faced).—First, R. Fulton. Highly Commended, F. Key; C. Vaux.

TUMBLERS (Almond and Common).—First, C. Harrison. Second, J. Kelso. Highly Commended, T. C. Taylor, Middlesbrough.

TUMBLERS (Mottles, Self-colours and Common).—First, J. Hawley. Second, R. Fulton. Highly Commended, W. Petre, Felling, Gateshead; J. Hawley.

TUMBLERS (Bearded and Common).—First, J. Fielding, jun. Second, J. Thompson, Bingley. Highly Commended, W. H. C. Oates; H. Morrow, Gateshead; T. Milne, Newcastle.

TUMBLERS (Bald-headed and Common).—First, J. Fielding, jun. Second, H. Morrow. Highly Commended, J. W. Edge; W. B. & H. O. Blenkinsop; F. J. Leach; J. Pringle; R. Fawdon, Gateshead; J. Fielding, jun. Commended, R. Fulton; J. Hawley.

BARBS (Black).—First, W. B. Van Haansbergen. Second, R. Fulton. Highly Commended, G. Charney, Preston; F. J. Leach; R. Fawdon. Commended, E. Brown.

BARBS (Any other colour).—First, J. Firth, jun., Dewsbury. Second, E. Horner, Harewood, Leeds. Very Highly Commended, G. Fawdon, Gateshead. Highly Commended, G. Charney (Dun); Baxter & Daniels. Commended, F. J. Leach (Red).

JACOBS (Red or Black).—First, J. Thompson. Second, J. B. Pinder, Harpurhey. Very Highly Commended, J. B. Pinder; W. B. Van Haansbergen, Newcastle; E. Horner. Highly Commended, E. M. Boyd, Rochdale; R. Fulton; E. Brown; W. B. Van Haansbergen. Commended, J. W. Thompson, Hull; W. R. & H. O. Blenkinsop; H. Yardley, Birmingham; C. Vaux.

JACOBS (Any other colour).—First, E. Horner. Second, F. Key (Yellow). Highly Commended, J. W. Edge; J. and W. Towersou, Egrement.

FANTAILS (White).—First, J. Smellie, Wishaw. Second, J. Hawley. Highly Commended, W. Petre; W. H. Tomlinson, Newark-on-Trent; W. R. Park, Melrose; T. Martin; F. J. Leach; W. B. Van Haansbergen; G. Fawdon.

FANTAILS (Any other colour).—First, J. W. Edge. Second, T. Martin, Edinburgh (Blue). Highly Commended, H. Yardley (Blue); J. Fielding, jun.

TRUMPETERS (Mottled).—First and Second, E. Horner. Highly Commended, W. H. C. Oates; J. Firth, jun.

TRUMPETERS (Any other colour).—First, W. H. C. Oates (White); Second, E. Horner. Highly Commended, J. Firth, jun.; E. Horner.

OWLS (Blue or Silver).—First, J. Fielding, jun. Second, W. R. & H. O. Blenkinsop. Highly Commended, N. Dunn; W. R. & H. O. Blenkinsop.

OWLS (Any other colour).—First and Second, J. Fielding, jun. Highly Commended, J. Thompson (White); Miss F. Easton (Blue tailed White); W. B. Van Haansbergen (Black-tailed White). Commended, Miss F. Easton, Hull (Black tailed White).

NUSS (Any colour).—First, W. Croft, Killinghall. Second, A. B. Bailey, Shooters Hill, Longton. Highly Commended, J. Thompson; H. Beldon, Giltsook; J. Bell, Newcastle; F. J. Leach (Black); E. Horner; T. Bailey, Sowerby.

BUNTS (Any colour).—First, S. Robson. Second, H. Yardley. Highly Commended, W. B. Van Haansbergen.

DRACOONS (Any colour).—First, E. Wilson (Blue). Second, Chaloner, jun. Very Highly Commended, J. W. Edge; F. Sale, Derby (White). Highly Commended, H. Morrow (Blue); P. Stephenson, Gateshead (Silver); F. J. Leach. Commended, Capt. C. B. Fisher, Aberdeen.

MAGPIES (Any colour).—First, E. Horner. Second, P. Stephenson (Black). Highly Commended, T. Martin (Yellow); F. J. Leach (Blue and Black); J. Sharp, Johnstone, N.B.

TURBITS (Crested or Shell crowned).—First, F. Sale (Red). Second, H. Yardley. Highly Commended, J. W. Edge; J. & W. Towersou (Red); W. B. Van Haansbergen (Red and Yellow); R. Siddall, Sheffield; J. Thompson. Commended, E. Horner.

TURBITS (Point-headed, or Peaked).—First, E. Horner. Second, R. Fawdon. Very Highly Commended, F. J. Leach (Yellow); E. Horner; J. Fielding, jun. Highly Commended, J. Thompson; Pickering & Marshall, Driffield (Red). Commended, A. B. Bailey (Blue); T. Bailey (Blue); T. Martin (Red); F. J. Leach (Red); W. Longmoor, South Shields (Blue); R. Fawdon.

TURBITS (Plain-headed).—Prize, J. Thompson.

PIGEONS (Any other variety).—First, E. Norman, Northampton. Second, E. Horner. Highly Commended, H. Beldon (German); A. H. Stewart (Japanese Terns); J. Hawley; W. R. Park; H. Yardley. Commended, J. T. Stott, jun., Alnwick (Antwipers).

SELLING CLASS FOR PIGEONS.—First, A. H. Stewart. Second, J. Hawley. Highly Commended, H. Beldon; T. Bailey; W. Moon; J. Hawley; G. Charney, Preston; H. Yardley; C. N. Lythe, Cottingham, near Hull; R. Siddall, Sheffield. Commended, E. Brown; W. Moore; C. N. Lythe; T. Bailey.

CANARIES.

BELGIAN (Clear Yellow).—First, J. Miller, Newcastle. Second, T. Bennett, Newcastle. Very Highly Commended, J. Baxter, Newcastle.

BELGIAN (Clear Buff).—First, J. Baxter. Second, J. Howey, Bertley, Durham. Very Highly Commended, R. Hawman, Middlesbrough. Highly Commended, J. Bexson, Derby. Commended, T. Bailey.

BELGIAN (Variegated or Marked Yellow).—First, J. Bexson. Second, Very Highly Commended, and Commended, J. Baxter. Highly Commended, W. Petre.

BELGIAN (Variegated or Marked Buff).—First, J. Bexson, Hexham. Second, J. Baxter. Very Highly Commended, W. H. Phillips. Highly Commended, R. Hawman.

DON (Clear Yellow Glasgow).—First, J. Soulsby, Newcastle. Second and Very Highly Commended, G. Nicholson, Newcastle.

DON (Clear Buff Glasgow).—First, J. Soulsby. Second, G. Nicholson.

NORWICH (Clear Yellow).—First, J. Bexson. Second, J. Wynn, Northampton. Very Highly Commended, G. Moore, Northampton. Commended, T. & J. Irons, Northampton.

NORWICH (Clear Buff).—First, G. Moore. Second and Very Highly Commended, T. & J. Irons. Highly Commended, J. Bexson.

NORWICH (Variegated or Marked Yellow).—First, G. Moore. Second, J. Wynn. Very Highly Commended, J. Smart, Newcastle. Highly Commended, R. Hawman. Commended, F. Johnson.

NORWICH (Variegated or Marked Buff).—First, J. Wynn. Second, R. Hawman.

LIZARD (Golden-spangled).—First and Second, J. Taylor. Very Highly Commended, F. J. Leach. Highly Commended, R. Hawman. Commended, A. Upton, Wishaw, N.B.

LIZARD (Silver-spangled).—First and Commended, R. Hawman. Second, J. Taylor. Very Highly Commended, J. N. Harrison, Belper. Highly Commended, F. J. Leach.

DUN (Yellow Cinnamon).—First, T. & J. Irons. Second, S. Tomes, Northampton. Very Highly Commended, J. Wynn, Northampton. Highly Commended, R. Hawman. Commended, G. Moore.

DUN (Buff Cinnamon).—First, G. Moore. Second, J. Wynn. Very Highly Commended, S. Tomes. Highly Commended and Commended, T. Dobson, Newcastle.

DUN (Variegated or Marked Yellow).—First, J. Wynn. Second, G. Moore. Very Highly Commended and Highly Commended, S. Tomes, Northampton.

DUN (Variegated or Marked Buff).—First, Second, and Commended, J. Baxter. Very Highly Commended, S. Tomes. Highly Commended, G. Atkinson, Gateshead.

CLEAR GREEN.—First, J. Smart. Second, L. Billcluff. Very Highly Commended, T. Dobson. Highly Commended, S. Atkinson. Commended, J. Baxter.

COMMON (Buff Four-Marked).—First, J. Baxter. Second, R. Hawman. Very Highly Commended, J. Stephens, Middlesbrough. Highly Commended, R. Heel. Commended, G. Atkinson.

MULES.

GOLDFINCH MULE (Buff).—First, R. Heel. Second, G. Atkinson. Very Highly Commended, L. Billcluff.

GOLDFINCH MULE (Dark).—First, J. Robson. Second and Very Highly Commended, F. J. Leach. Highly Commended, T. Dobson.

ANY OTHER MULE.—First, S. Tomes. Second, J. Baxter. Very Highly Commended, J. Bexson.

MISCELLANEOUS.

GOLDFINCH.—First, R. Heel. Second, J. Miller.

LENET.—First, W. Petre. Second, A. Hogg, Newcastle.

The Judges were T. J. Charlton, Esq., of Bradford, for Pigeons, and Mr. T. Clark, of Sunderland, for Canaries, &c.

FEEDING BEES IN WINTER.

BEES may be kept alive and well in winter by scooping the pith out of pieces of elder, leaving the ends closed, and filling one or two for each stock with either honey or moistened sugar. It would not, perhaps, do where bees are kept on a large scale, but it is very simple, and the food should be supplied daily. They will take it readily.—L. B.

LARGE HIVES.

NOTWITHSTANDING the very able manner in which Mr. Pettigrew has advocated the use and efficiency of his large hives, in page 333, and the emphatic manner in which he condemns other hives as being almost utterly inadequate for the accommodation of a swarm of bees and their honey, in spite of the abundant harvests that have been obtained from what we may call improved hives, but which appear to be in his eyes quite the reverse, I think his letter may bear a little criticism, and would submit to your readers a comparison of the different hives.

I shall first take into consideration the circumstances under which a hive is most likely to prosper in the spring, and as the management of wooden hives has already been described, and they have been proved to be in no way inferior to straw ones, I will pass over Mr. Pettigrew's remarks condemnatory of wooden hives, and will confine myself to the subject of their size, showing the advantages and disadvantages of large hives, or the disadvantage of large and advantage of small ones. Even in the case of the largest and strongest hives which I ever possessed (and I have had them equal to 250 lbs. in the season), I have found that two Stewarton body boxes, or one stock box of a frame hive, held the whole of the bees of these monster hives at the end or in the fall of the year. Now it is evident that by the spring the bees will again have dwindled considerably; and if they are at this time in a large hive they must labour under a very great disadvantage, from occupying only a small part of the hive in comparison with its size. The bees, not being able to keep up a proper degree of warmth, are restricted to breeding in a very much less space than if they were in a smaller hive which is capable of being enlarged at will and as need requires. This is the advantage of the Stewarton hive not being over-wide. The bees are able to spread themselves from side to side, and then a proper heat is engendered, and breeding goes on much more rapidly than in a hive that is of a larger diameter than the bees can cover. A Stewarton hive of two boxes each, 6 inches deep, or a Woodbury frame hive, contains cells enough for a queen to lay 2000 eggs daily, with a little space for honey and pollen. Now, as queens do not lay that number of eggs until April or May, I cannot see any advantage in having large hives before that time, but would then give a nadir, which will render the hive capable of containing some honey and pollen, as well as cells enough for hatching 3000 eggs daily; and what more can be required? as until we put on supers nothing more can be done. Thus much for our small hives, whereas large stock hives require a long time ere supers can be put on; and as honey, pollen, and brood lie quite contiguous to each other, no proper separation of them can be effected without a lamentable sacrifice of empty combs, pollen, and brood with the honey; besides which, many more eggs are wasted in a hive that is too large than in one of smaller dimensions.

When Mr. Pettigrew speaks of the Ayrshire or Stewarton hives being too small, he evidently knows but little about them. The fact is, they are practically without limit, and what more would he have? He then says that if these hives were "properly managed much more honey would be obtained." We shall all hail the lesson with delight when Mr. Pettigrew teaches us how to manage them properly; but I would state emphatically that the world has not yet produced in quantity and quality honey equal to that obtained from the Stewarton hive; and I am certain if Mr. Pettigrew, as well as the Carlisle people, would but adopt the Ayrshire hives, and only half manage them, they would find them much more profitable, and would then be able to send first-class honeycomb to the market, whilst the inferior run honey which they now produce would gradually disappear.

I need scarcely notice the statement Mr. Pettigrew has made as to the superiority of his hives, since I need do no more than refer to the one described by "A RENFREWSHIRE BEE-KEEPER" in page 293, and to many more on the same principle that have attained weights far exceeding those described by Mr. Petti-

grew. By all means give bees free communication with their supers, but I see no use in giving bees so much room to pass as he describes. Any communication equal in size to the doorway of the hive is large enough. Anything beyond that tends to the production of brood and pollen, with blackened comb, in the supers.

I hope your readers will observe, that although I detest the use of large stock hives, I also condemn all small hives not capable of being enlarged. I recommend small stock hives with adequate means for enlarging, instead of large stock hives, as being on the progressive system; whilst Mr. Pettigrew is certainly retrograding, as I have hives similar to those described by him laid aside very many years since, and neighbouring bee-keepers have in their possession large hives, with dates nearly half a century back, describing their weight at that time as being so heavy that it took two men to lift them. Notwithstanding all this, large stock hives ought to be regarded as things of the past—at least they will be so by—A LANARKSHIRE BEE-KEEPER.

OUR LETTER BOX.

HOUDEANS AND HAMBURGS AS LAYERS (M. C.).—We believe Hamburgs will lay more eggs than Houdans, but the Houdans' eggs are larger. We once knew a hen that laid 240 eggs in a year. She never laid again, and died soon afterwards. This is the only instance we have known in many years, and we do not believe in birds laying such numbers. It is against nature, and we hold it to be quite impossible. Crève-Cœur are great layers, and lay very large eggs. We quite agree with you that it would be better if people would count their eggs instead of guessing at the numbers.

MATCHED BIRDS IN A PEN (An Exhibitor).—It is essential to success that fowls match well. We should consider perfection of shape more important than absolute similarity in every feather, and should also look for size and weight, as they are points in Brahmas. Given that there are no glaring faults of feather, we should place shape and weight before colour. Recollect that small Brahmas show at a great disadvantage. Eschew vulture hocks.

CRUSHED OATS (G. F. C. O.).—These are as good for fowls as ground oats.

SILVER-SPANGLED HAMBURGS (E. A.).—We should prefer No. 1. The tail-coverts are not so important as the sickle, which seem to be equally good in both. No. 2 seems to be deficient in respect to size and comb. The laced feathers do not disqualify. It is a serious defect in a pullet to have a light hackle. Choose the clear tails with moony tips, dark hackles, and well, regularly mooned bodies. Avoid patches either of white or black. The deaf-ears must be white.

PATRIDGE OR GROUSE COCHIN-CHINAS (F. C.).—White marks in the earlobes of a Grouse Cochinchina will not disqualify. Yellow ones are very common. If your cockerel at seven months weighs 9½ lbs., he is rather above than under the mark, and is an excellent bird so far as weight is concerned. They should be perfect at twelve months, and in their prime. The second cockerel you mention is unfit for competition. He is disqualified by the brown feathers, and an indifferent comb is a grave fault.

KEEPING DUCKS (C. Jackson).—You may keep Ducks in any place where they can have an outlet, either into a yard, or to garden ground or grass land. They require but little water, and are by no means dainty. It is not necessary to keep a drake, unless you intend to set the eggs. You will find instructions for their management in the "Poultry Book for the Many," which you can have free by post from our office for seven postage stamps.

FRAUDS AT POULTRY SHOWS (A Suffolk Man).—We shall be obliged by your stating your name and address, as well as the name of the person who acted so fraudulently. We shall make use of neither without your permission, but to publish such a statement, merely pointing to "the eastern counties," is casting suspicion on many.

CHESTER POULTRY SHOW.—Mr. Jas. Smith writes to us that he took the second prize for Spanish, and not Mr. Walker.

LOST PIGEONS (T. Newell).—We do not think that you could recover the value of the lost Pigeons from the Committee of the Skipton Show. In the first place, you acknowledged that you must submit to the loss by offering a reward for the recovery of the birds; but even if you had not done so, we think committees neither are, nor ought to be, liable for lost birds, unless gross carelessness can be proved, for exhibitions are not for the benefit of the committees, but for the benefit of the exhibitors.

BELGIAN RABBITS (D. of H.).—These are the same as the so-called Fawn-Rabbits. The Andalusian is the largest breed. It is much cultivated about Paris under the name of the Ram Rabbit. Any variety can be bred next spring. We cannot name either dealers or prices.

POULTRY MARKET.—NOVEMBER 25.

THE demand for everything is deplorable, and sales can hardly be effected for any but the choicest goods. We have seldom or never seen such continued stagnation.

From observations taken near London during the last forty-one years, the average day temperature of the week is 47.8°; and its night temperature 35.6°. The greatest heat was 69°, on the 7th, 1861; and the lowest cold 11°, on the 5th and 6th, 1841. The greatest fall of rain was 1.02 inch.

OUT-OF-DOORS GRAPES.

JUDGING by the many fine old Vines that are to be met with on walls and houses throughout the country, it would seem that Grapes have been much more cultivated in the open air in times gone by than they are at the present day. The practice of growing Grapes in the open air seems to have gone out of fashion of late years. It is very seldom indeed that we see or hear of vineyards or the planting of Vines at the present day anywhere excepting under glass. Why is this?

That certain kinds of Grapes can and may be cultivated in the open air in this country with a fair amount of success, if proper attention be paid to them, is tolerably certain. In a few spots, indeed, they are still largely cultivated, as at Mr. Darkin's vineyard, Bury St. Edmunds, and the Rectory, Woodstock (by Mr. Fenn), both for use as dessert fruit and for making wine; but these are exceptions. Grapes, it is true, are more abundantly cultivated, and enjoyed in far greater quantities, than they ever have been, but that is owing to cheap glass, ground vineries, orchard houses, &c. It is to be regretted, however, that the open-air cultivation of the Vine should be neglected, as, however cheap glass and glass structures may be, and plentiful and good as the supply of Grapes is, they are not within the means of every one. I am sorry to note the disappearance of the familiar Vine from the walls of our gardens and houses, especially from those of the dwellings of the humbler classes. I like to see cottages with Vines trained against them, and loaded with the clusters of the tempting-looking fruit; and how much more pleasant it is to eat the Grapes of one's own growing, although they may not be quite so fine as those that may be purchased. In ordinary seasons really excellent Grapes can be cultivated on the open wall with very little attention, which, however, is rarely, very rarely, bestowed on them. I have tasted Royal Muscadine Grapes, both this season and last, equal to, yea, better than, those that are ordinarily supplied for dessert at the restaurants in Paris. If our summer be unusually cold and wet, as it sometimes unfortunately is, and the Grapes may not become sweet enough for table, then wine, good, wholesome, sparkling Champagne, can be made from them, such as was enjoyed by the Fruit Committee from Mr. Lovegrove, of Maidenhead, and such as I have tasted with Mr. Frost, of Dromore.

The Rev. George Kemp did good service in furthering the cultivation of the Vine in the open air, by offering special prizes for the fruit so produced at the meeting of the Royal Horticultural Society's Fruit Committee on October 20th. It was a happy idea of Mr. Kemp, and a more favourable season for such an exhibition could not possibly have been, it having been almost tropical in its character, and particularly well suited for Grapes. The exhibition at South Kensington, however, although the examples and exhibitors were numerous enough, was not a very successful one. I have seen better Grapes in many parts of the country, and I believe if this exhibition were

repeated better Grapes would be submitted. Some of the examples were handsome enough in appearance, and others were excellent in flavour, but taken as a whole, they were below par. Few of them, I daresay, had had much attention bestowed upon their cultivation, but being by chance presentable, were in due course exhibited. Now, I should like to do away with this chance-work, and have a little attention bestowed on them, so as to produce a desired result the same as with Grapes under glass. Of those exhibited at South Kensington, the collection which displayed the greatest cultural skill and care was that of Mr. Lynn, of Hedsor Gardens, which was awarded the second prize; they were Black Hamburgs remarkably well grown, clean, and good. They were, however, inferior in flavour to the Royal Muscadine exhibited by Mr. Foster and Mr. Earley, which obtained the first prize; Mr. Kemp's object in offering the prizes not being so much the calling forth of cultural skill in the production of any variety, as to discover which of the many varieties is the Grape most suited to open air-cultivation.

Royal Muscadine.—This has been approved as the best out-door Grape. Judging of its value by flavour as a dessert fruit, combined with constitution and appearance, it is, in my opinion, the most useful variety, and that which I always recommend for planting in the open air. It is of a very hardy constitution, and fruits very freely, the bunches being of good size, and the fruit generally ripening pretty well. This is the same Grape as is cultivated so largely in France, and sold in the streets under the name of Chasselas de Fontainebleau; it is also the most common white variety in this country in open-air cultivation. Sometimes it is called White Chasselas, but more frequently confounded with the White Sweetwater. When grown in the open air, the sides of the berries next the sun are generally much covered with a cinnamon russet. Indeed, Monsieur will not purchase or enjoy his Grapes unless they are thus discoloured; to him it is a mark of excellence, in which I believe he is right, to us a blemish.

Having stated these opinions on the open-air cultivation of the Vine, and named the one best adapted for the purpose, as far as my knowledge goes, I shall now pass in review some other varieties which have come under my own observation, and which are frequently recommended for out-door duty.

Dutch Sweetwater.—This variety ripens its fruit well, the berries are large, and they are of very good flavour, and sweet. Its great fault is its setting badly. If it could but be made to set its fruit thoroughly, instead of a straggling berry here and there, it would prove the most valuable of all. As it is, it cannot be depended on.

Black Hamburgh.—In warm seasons this is an excellent variety, producing an enormous crop, but it seldom colours well. Last season being warm, it was in many places first-class. Recommended for making wine.

Black Prince.—This is a very taking Grape, producing bunches of large size, which always colour well, and look very handsome. It will colour quite black, although not half-ripe, the berries frequently being quite acid and sour. Even when ripe and in its best character, it is not pleasant

to eat, being very leathery and thick-skinned. Useful for producing quantity, but quite third-rate in quality. Cambridge Botanic Garden is the same as Black Prince, having succeeded well in that garden, hence its name.

Espiran, or *Esperione* as it is commonly but erroneously called, is a much-vaunted hardy Grape, yet I have never tasted a berry of it from a plant in the open air that was much better than a sloe. It colours well, and has the appearance of being good, yet it is not so. When grown in heat under the best conditions, this Grape is not worth eating. It has received much praise as an excellent hardy Grape, to which it can lay no claim whatever. It was, I believe, the late Mr. Donald Beaton who first gave it this false character; he, with his usual fire, extolling it to the very skies, not knowing at the time that the subject of all his praise was not the *Esperione* at all, but simply a fine example of the true Black Hamburgh. Although not at all suited for dessert, it is an excellent wine-making variety.

Miller's Burgundy.—This is a very hardy and free-fruited variety. The bunches are rather small, but very numerous, and the berries small, and very closely packed together.

Black Cluster, *Port Wine* or *Claret*, and *Black July*, are all very similar to the preceding, and of about equal merit, the last somewhat earlier, and perhaps not quite so sweetly flavoured. In ordinary seasons these ripen well, and are very good in flavour; the berries just a little too small, and so crowded together that it is difficult to make a commencement on a bunch. All of them are excellent for making wine, and deserving of cultivation.

White Frontignan, *Black Frontignan*.—I have found both of these do exceedingly well against a wall. Their flavour is naturally rich and piquant. Even when only half ripe they are considerably so, and are very pleasant to eat; just the reverse of Black Prince and *Espiran* in that respect.

In addition to these there are the following, which, I believe, would prove valuable, and well suited for open-air culture, all of them being early; but I have as yet had but little opportunity of proving them myself—viz., 1, Early Saumur Frontignan; 2, Early White Malvasia; 3, Pitmaston White Cluster; 4, Chasselas Hâtif de Tonnein. The second is the same as the Grove-End Sweetwater, an excellent flavoured sort; the fourth, a few days earlier than it—indeed, the earliest white Grape I am acquainted with, small in berry, but sweet. There are scores of other varieties of the small French Chasselas and Muscats that are, perhaps, equally well adapted for the purpose, but as Grapes attaining their full perfection in the open air in this country, there would be little distinction in point of flavour from those in the same classes which I have already enumerated, which are those in most general cultivation throughout northern France and Germany.

All Vines are hardy; some are of more succulent growth than others, and the wood requires a greater degree and a longer duration of heat to become ripened thoroughly—that is constitution. But the tenderness or otherwise of the Vine lies not there so much as in the fruit itself; in short, in its early or late-ripening properties. A Grape, when said to be hardy, simply receives the character of ripening its fruit earlier, and with a less amount of heat than another. There are some which will not set their fruit freely, excepting in a high temperature, such as the common Muscats; but with few exceptions, the most of our Vines will just produce as many Grapes in the open air as in the warmest vinery. Our summers, however, being usually so low in temperature and so short, there are but few varieties of Grapes that ripen sufficiently to become eatable. They are, however, suitable for a certain kind of wine, unless the summer be unusually cold, when some sorts refuse even to swell their berries. The Muscat of Alexandria itself has produced here on the open wall almost every year a good crop of fruit, fine large bunches and berries; yet the fruit is never eatable, always acid and sour. Only once have I detected any traces of the true Muscat flavour in it.

In advocating the cultivation of the Vine in the open air, let it not be imagined that I recommend it in any case where glass structures can be secured. Our English climate is usually too cold for any great amount of success or satisfaction ever being attendant on such a method. Where glass can be used, whether in the form of our common vineries, orchard houses, or ground vineries, I say, Adopt them, and not be dependent on securing a single bunch of Grapes from Vines planted in the open air; yet there are hundreds of places throughout the country where no assistance from glass can be obtained, but

where there may still be a little space to spare on a wall, or the end of the dwelling-house, as in our smaller villa gardens and in those of the working classes. In such cases a Vine or Vines may be planted, and by a little ordinary attention a tolerably decent lot of Grapes may be grown. Independently of the fruit, the Vine is a very ornamental plant in itself for the covering of bare walls, &c. See how well Vines grow, and how noble they look in the Royal Horticultural Society's Gardens, South Kensington, where they have been planted to hide the beautiful and costly brick arcades! These Vines have been planted but a few years, and they are annually loaded with beautiful fruit.

To secure success in the cultivation of Vines in the open air, it is just as necessary for them to be planted in a well-prepared border as in any other case, and that the same attention should be given to their pruning and training as is ordinarily practised in the best-managed vineries—matters which are very seldom thought of, the Vines being just planted in any sort of soil, and allowed to ramble as they will. The great enemy to the Vine in the open air is mildew, which is sometimes very difficult to subdue, yet by continued applications of sulphur it can be kept in check out of doors as well as under glass.

I have been induced to offer these few remarks on this subject through having been applied to for information—1st, As to whether Grapes sufficiently good for dessert can be cultivated with any success in the open air in this country? 2nd, If so, which is the best variety for that purpose? In answer to the first question I sum up my remarks, and say that certain varieties can; to the second, that the best Grape for open-air cultivation is the Royal Muscadine.—ARCHAMBAUD.

CORDONS, BUSHES, PYRAMIDS.

UNDER the above heading there is to be found in "our Journal" of the 12th of March last, page 198, an interesting and sensible letter, signed "C. C. E." To that letter on the 26th of March, page 231, Mr. Rivers wrote a reply, and "C. C. E." followed with a rejoinder on the 16th of April, page 291. At the close of the first letter referred to, "C. C. E." promised, if wished, to give at some future time further notes on his experience in fruit-growing. Will "C. C. E." now make good his offer? The fruit season may now be said to be fairly over, and an instalment will, I am sure, assist in fulfilling the objects of your Journal.

There is a remark in the second letter, suggesting that Mr. Rivers's plantation of Cox's Orange Pippin, with the trees 3 feet apart each way, is more curious than desirable, more of a mere horticultural feat than a system to be followed by the ordinary fruit-grower. I quite agree with the writer here, and I am, therefore, the more curious to know whether his additional experience has confirmed this view or not. Also, if he would state the area and aspect of his ground, and some further particulars of his watering arrangements, I think his communication would be the more practical.—CORNUBIA.

[In answer to the foregoing "C. C. E." writes as follows:—"I had intended, partly from lack of time, partly because the season of 1893 has been, as far as my experience goes, so disastrous to biennial removers of fruit trees, to remain silent on this subject for the present; but when so courteously challenged by 'CORNUBIA,' I gladly take pen in hand in answer to his inquiries and in fulfilment of my promise, asking him and all to remember that this is but my sixth year's practice, and that I am a learner and not a teacher in the school of Pomona.

"To begin in order, my eighteen cordon Pear trees on a boarded fence having been planted two years were lifted, and in order to make room for new leaders, reduced to twelve. This season two fruit of Williams's Bon Chrétien and six of Doyenné d'Été were the sole produce. Alas! how short of the (by some) expected crop of twelve, or even six fine fruit each.

"Next I turn to my plantation of 122 bushes on Paradise and Quince stocks, planted in 1865. Most of these were lifted last winter. Of the crop I cannot speak, there was none worthy the name. Fourteen bushes of Cox's Orange Pippin produced one fruit (6 czs.), and an abortion; Kedleston Pippin and Normanton Wonder, a few sickly fruit, which seemed reproachfully to bewail their lost roots, and occasioned many reflections on Dame Nature and 'lifting.' Williams's Bon Chrétien and Beurré de Capiaumont stood the operation best, but looked far from healthy. A peck basket would have more than contained the whole produce of 122 bushes; but as most of these were

left for three years without any interference with their roots, this plantation cannot be considered as fairly representing the results of biennial lifting.

"In another plantation of 342 mixed fruit trees, nearly all were lifted last winter, having stood two years. They bloomed finely, and, book in hand, I daily noted their peculiarities—continuance in bloom, appearing of leaf; size, position of bloom, &c., and, in fact, counted the chickens which were never hatched. Frosts came and destroyed some sorts. That did not matter, there were others to bloom, and eventually there was every appearance of an abundant crop after the frost had departed; and as long as my water supply lasted the engine worked and defied the drought on the half of the plantation which it commanded; but when water failed us the trees had no strength to continue their efforts, and the crop dropped off, leaving only a few odd fruits here and there—for example, eight trees of Rivers's Early Prolific Plum ripened twenty-seven fruit, and twelve of Diamond forty-two fruit. These were by far the most prolific of any; two medium-sized school-boys ate the whole produce of more than fifty trees without any apparent effort or inconvenience. Beurré gris d'Amboise, a Pear whose leaves precede, and so protect its blossoms, bore a fair crop, whilst all the trees not lifted, seven Beurré de Capiaumont and forty-five Apples, had good fruit for their diminutive size.

"And now we pass to another mixed plantation of seventy-one trees, mostly on Pear and Crab stocks, two years old, and mostly lifted *à la Rivers* last winter. These are in a worse plight than those on the Quince and Paradise; many have been in *extremis*, some are not safe now. No tree that was lifted matured a fruit, but of the sixteen not lifted two did well. A Beurré Clairgeau produced sixteen fruit, weighing 9½ lbs. This tree is 4 feet 1 inch high (measuring to the last pruning), and on the Quince stock; the other, a Beurré de Capiaumont, 4 feet 3 inches high, on the Crab, produced sixty very handsome fruit, and is, in fact, the most perfect pyramid that I have ever had the pleasure of seeing.

"My garden of fruit trees is about two acres in extent, and faces south. If 'CORNUBIA' desires more particulars of my arrangements for watering than are to be found in page 231, to which he refers, I will gladly give him any information privately through the Editors. I refrain from saying more on that subject, because my method, though suited to my particular location, is not capable of general application.

"My 'additional experience' has fully confirmed my previous conclusion, that it is a mistake to dwarf trees so much as to confine them to one square yard. I regard it as an interesting horticultural feat, and if they were to prove productive even proportionately to their size, taking one year with another, I would term it a triumph; but when once the idea of substantial produce is contemplated, my experience teaches me that such dwarfing is an absurdity.

"And now may I be pardoned a few more general remarks. Since last my initials appeared in these pages I have had the great pleasure of making the personal acquaintance and receiving the known hospitality of Mr. Rivers, who, with the most friendly courtesy, showed me over his extensive gardens and nurseries. I confess my first 'point' was his plantation of eight year-old Cox's Orange Pippins, which I viewed with curiosity and a satisfaction free from envy; but I could not help remembering the remark of a rustic, when a few weeks previously we witnessed in a circus the extraordinary performances of a child some eight or ten years old, 'Zur,' he said, 'that's a strange bairn, that be, for a young un, but he weant never grow up worth nowt.' Next, having read of Mr. Rivers's recent triumph, I went with much interest to his Cherry orchard house, and had I travelled from Lincolnshire for that express purpose, I should have felt amply repaid by the sight; nor did my satisfaction end here, for having fully satisfied the most capacious fruit appetite, I could perceive no sensible diminution in the crop. I shall not attempt to describe the many things of interest to be seen at Sawbridgeworth, but cannot help noticing the endless acres of beautiful clean-grown young fruit trees, enough to provoke any one to embark in their cultivation, but will conclude with a remark or two which this last season's experience suggests.

"I consider that every bush or pyramid requires lifting in the second year after planting, that its roots may be set in order once for all; the long straggling roots without rootlets save at the extremities, which I find are produced in all soils, no matter how rich, being cut back quite home. After this I would never lift again, but check over-luxuriant growth by root-

pruning, first on one side, and then on the other. This does not give the tree so great a check as to endanger the succeeding crop. The earlier this is done in the autumn after the leaves begin to drop the better. My present method of planting is to place the trees 6 feet apart each way in quincunx order, to dig a trench between the rows from left to right one year, and from right to left the next; thus two sides of each tree are accessible, and the roots cut if necessary every season; and the trench being filled in and well manured a good crop of Lettuces or other vegetable is obtained, and no ground wasted. Meanwhile the trees are encouraged to grow as much as they will, consistently with the production of short-jointed wood, and fruit spurs. In time they will entirely occupy the ground, leaving, of course, no room for rows of vegetables, and thus I have every confidence in the success of bush fruit-tree culture. I now again remind my readers that I am a learner and not a teacher; I simply state the results of my experience and the conclusions they have led me to, and until I have learnt something very different from what I now believe, there will be no more biennial removals perpetrated by—C. C. E."]

BARBAREA VULGARIS VARIEGATA.

SOME of the readers of the Journal who are in the habit of furnishing their flower beds in winter with evergreen plants and other odds and ends, may not be aware of the highly ornamental appearance of this old herbaceous plant during that season.

It is the single yellow Rocket in a variegated form, the leaves being beautifully blotched and marbled with white. It presents one of the most notable instances with which I am acquainted of the unvarying reproduction of variegation by seed. In a large bed of it, which I sowed last spring, not a single green-leaved plant could be found.

To have it fit for planting in October, seed should be sown about the end of March, somewhat thinly, as every one will vegetate, and, if necessary, the plants should afterwards be thinned out to 6 inches apart. When transferred to the flower garden good balls should be taken with them, otherwise the leaves are apt to assume for some time a rather brownish hue. Two-year-old plants are, however, better than these. After they have flowered and the stems have been cut away, they throw up a profusion of nearly white leaves in autumn, which, under any circumstances, except looking up among the snow, have a very attractive appearance.

It seeds as freely as any other Cress, so freely, indeed, that if not cut over in time it becomes rather a nuisance, the little pibbled seedlings coming up everywhere, even on the hard gravel walks. When and where it originated I have never learned, but it is an old plant, and common enough in many cottage gardens, although very seldom met with elsewhere; nor do I ever recollect seeing it mentioned in any seedsman's catalogue.—AYRSVILLE GARDENER.

TRENTHAM BLACK GRAPE.

SEEING your remarks in page 389 with regard to the keeping qualities of this Grape not being equal to those of the Black Hamburgh, and as my experience is somewhat different, I will state it. I have four rods of it full of fruit at the present time. Four years ago I found this Vine, as well as others, not in a very flourishing state, the roots being confined to the inside of the house, owing to the arches having been built up. As soon as I could I had the arches cleared out, and commenced making a new border, so as to encourage the Vine roots outside. The result is, at the present time the Vines are in splendid health, and bearing fine crops of Muscat of Alexandria, Muscat Hamburgh, and Trentham Black Grapes.

Now to return to the Vines four years ago, when confined to the inside of the house. In the following summer, being desirous of housing as good Grapes as possible under the circumstances, the inside border received copious supplies of liquid manure from the cow yard, and the Vines improved very much, the Grapes swelling as well as could be desired, the Trentham Black being fine. To make sure of a good "finish," more strong water was given just as the Grapes began to colour; the result was that the Trentham Black went as you have described. Bought experience, however, is generally useful; therefore in the following season the Vines were treated the same as in the previous year up to the time of storing, when water was completely withheld from the Trentham Black, and

only given once or twice to the Muscats. The result was that not a cracked berry was to be seen; but the means of heating the houses was being altered from the old flues to hot water, and, as usual in all such undertakings, the alterations were a month or six weeks after the stated time before they were finished, so that the Treutham Black Grapes did not keep longer than a short time after Christmas. In the present season, however, the Grapes in this house, as I stated before, are all that can be desired, for the roots have gone the whole length of the new border; and at the time I write the Treutham Black Grapes are as black as sloes, and fine both in bunch and berry. I shall be very much mistaken if they do not hang good till the beginning or middle of February; indeed, in such high esteem is Treutham Black held here, that in every viney that is fresh planted it must have a place.—JAMES STEWART, *Nuneham Park*.

MUSHROOM CULTURE.

I TAKE the present opportunity to thank you for the advice you gave me on the growing of Mushrooms. I made my first bed with the material I named in my note—chiefly the long litter from the stable—which I had thrown into a heap to ferment itself dry, with a coating of 1½ or 2 inches of droppings on the surface. I spawned the bed when at about 74°, and earthed it at the same time with about 2 inches of light turfy soil. The result is that I have now, in about seven weeks after spawning, as fine a bed of Mushrooms as any one could wish to see. I have since made two more beds entirely of droppings, with a little of the short litter; the one has been spawned about three weeks, and the other has had the last coat of droppings put on to-day; but if these turn out as well as the first I shall be quite satisfied.

I write this for the encouragement of a correspondent who, a few weeks back, was asking for information on this subject, and stated that "he had read all that had been written in 'our Journal,' and had tried several times, but never had any Mushrooms." I may state that I am quite a novice in the affair myself, never having made a Mushroom bed in my life before, neither had I ever seen one made; but I worked as nearly as possible according to the directions you gave me, and by what I had read from time to time in "our Journal;" and I think if your correspondent will do similarly he will soon have plenty of Mushrooms.—AGAVEUS.

COMPARISON OF THE SUMMERS OF 1865 AND 1868.

Now that the growing part of the year 1868 may be regarded as at an end, a retrospect of its advantages and disadvantages, may not be out of place, especially at a time when so many are either disposed to disparage it too much, or run into the opposite extreme of giving it too glowing a character. As its favourable points may be best made apparent by comparing it with another season, I have selected 1865 as being within easy memory, and as being usually considered a good year. In the following comparison of figures, it will be perceived that in one of the main features the two more nearly approximate to each other than might be expected, and that feature is heat, in which it is supposed by some that the past summer has been hitherto unapproached. A brief attention to figures, however, shows that the average day temperature in the shade for the five summer months of 1865, presents an absolutely greater amount of heat than the average of the same months during the past summer. It is true the difference is but small, about one-tenth of a degree, but the fact is sufficient to reverse what idea we might have formed of the extraordinary heat of July. This difference of day temperature is, however, more than compensated by the warmth of the nights, as compared with 1865, the average being fully 1° to the advantage of the present year. Many people would suppose the summer of 1868 ought to have presented a much greater difference, and so it would had the average been taken at the end of August, instead of a month later, for it will be remembered, as well as shown by the accompanying figures, that September, 1865, was an extraordinarily warm month, much more so, taking the advanced period of the year into consideration, than the past July, notwithstanding its tropical heat. Now, this being the case, and last September not being in any way remarkable, the average for the two summers has been almost equalised, not but that a considerable difference must have resulted from the heat occurring this year in July, instead of in September, and the

advantages of the one summer as compared with the other offer a subject for consideration, which may be advantageously entered upon, after duly examining the accompanying tables.

The first table simply shows the mean maximum and minimum temperature, as taken daily at this place for the five months from May to September, in each year; and the second table simply gives the rainfall during the same months in each year.

TEMPERATURE.

1865.		
	Mean max.	Mean min.
May	79.93	46.23
June	76.73	48.46
July	77.10	51.51
August	73.30	50.50
September	78.08	53.13
Average for 1865	75.218	49.966

1868.		
	Mean max.	Mean min.
May	70.49	45.61
June	74.17	49.00
July	81.38	55.45
August	74.71	53.74
September	74.83	51.13

RAINFALL.

1865.		1868.	
	Inches.		Inches.
May	2.89	1.92
June	1.17	0.51
July	3.48	0.63
August	5.26	2.80
September	0.08	2.70
Total five months	12.88	8.06

Having already described the difference in the average temperatures of the above periods in 1865 and 1868 as being very small, the same certainly cannot be said of the rainfall of these years, and as this is as important an element for the welfare of vegetation as heat, it is tolerably evident there must have been considerable difference in the character of the two years. 1865 was here (Linton Park) the wettest year I have on record, more rain falling by an inch and half than in 1860, but it was much better distributed, and the summer being hotter it seemed that no more fell than was wanted.

Now, the question is, Have we had as much rain during the past summer as we thought was needful for vegetation? I fear the many prayers and anxious wishes put forth, proved that in our opinion at least, more rain during the hot months of June and July would have been acceptable, but as it was not so, we must compare the two seasons as they were, the one, 1865, a moist, warm, growing summer; the other, 1868, a hot, dry summer, ripening and perfecting well everything that had arrived at sufficient maturity before the effects of the dry weather were felt. It is not unlikely that our ideas of the merits of the respective seasons will be guided by the comparative importance we may attach to the crop that was growing and the one that was ripening. In 1865, two good crops of hay were obtained where only one indifferent one was produced in 1868, and the same observation holds good as to other crops: On the other hand, the ripening of tender subjects out of doors during the past summer, has, perhaps, never been exceeded before, that is, where such arrived at maturity before the atmosphere began to cool—by the middle of September. Since then the temperature has not differed from that of ordinary seasons, but the earth being warmer than usual from the great heat of July, tropical or subtropical vegetation continued to thrive from the accumulated heat in the ground, until, that being expended, farther advance in growth was not to be expected.

Even in the progress of tender plants there has been a marked difference in the respective characters of different plants; some that evidently enjoy the dry tropical heat of countries where rain seldom falls at certain periods have done well, and others which seem to require moisture as well as warmth, have failed accordingly. Of the latter class of plants, the best example I can point out is the large-foliaged *Wigandia caracasana*, which, in 1865, produced leaves at least 3 feet long, but those made this summer have not attained more than half that size, although the plants are upwards of 6 feet high and proportionably bushy. The Castor Oil plants, on the contrary, have reached a greater height, have flowered and seeded, and some of the seed seems almost ripe, but the plants were, perhaps, more ornamental in 1865, the joints between

the leaves being shorter. However, nothing need be said against this plant's growth during the past summer.

The foregoing examples will be sufficient to show that even as regards tropical vegetation, heat alone is not always sufficient to insure success, but that the combined action of heat and moisture are required to perfect certain things. The past summer has been as remarkable for some failures where moisture has been deficient, as for successes arising from the high temperature that prevailed. The blooming of one of our most popular autumn-flowering plants has this year, strange to say, been in our neighbourhood somewhat later than usual, the Chrysanthemum being really not fairly out in flower in the open air so early as in the majority of years, notwithstanding the forwardness of most other flowers that presented themselves early in the year—perhaps this may be attributed to the sudden change that followed the 12th of September—but the coarser and more robust vegetables of the kitchen garden, whose progress was arrested by the heat of midsummer, have grown rapidly enough when moisture in sufficient quantity was afforded them. The autumn of 1868 has, nevertheless, been less satisfactory than might have been expected, the rains not being so abundant as desirable, and frost setting in much earlier than usual.

In thus making a comparison between 1865 and 1868, it would not be fair to omit taking into consideration the prospects there may be for another year, and in this respect I am in hopes that the present one has certainly bequeathed to its successor tillage fields and garden soils highly improved by the scorching sun of July, and fruit and other trees matured in growth to such a degree as to insure, unless the spring be unfavourable, another fruitful year in 1869. Some other advantages, doubtless, will result from so unusual a season, and, on the other hand, perhaps some errors may be committed by expecting a succeeding one quite as hot, as occurred in 1860. The previous two warm summers then led many to surmise that tropical vegetation would prosper in our northern latitudes, and Chinese Sugar Grass and other crops were tried, but the year was dull, wet, and cold, the absence of sunshine being a more serious drawback than the amount of rain.

In respect to the abundance and quality of many of the most important products of the soil, 1865 may be said to stand superior to 1868, but at the same time the advantages which the latter has conferred on its successor make up for the inequality, as it is seldom that stiff heavy ground works so well as it has done this autumn, and the destruction of weeds and insects make us hope these pests will be less numerous next year than they often have been.

It is, however, more to the small difference in average temperature between the past and a former summer that I would call the attention of the curious in such matters, so that when it is necessary hereafter to speak of the great heats of 1868, it ought also to be mentioned that they were not of long duration; and that time, that leveller and smoother-down of all irregularities, natural and artificial, also confirmed the fact, that after all the whole summer of 1868 was but a mere fraction warmer than that which occurred three years previously, notwithstanding its tropical heats and the almost fabulous reports of its effects at the time. The effort would seem to have almost been too much even for Nature, the issue showing that she retired, as if exhausted, before the summer was over; but I leave the further reasoning on this to others, my purpose being merely to show the state of the two summers in plain figures.—J. ROUSSEAU.

CELOSIA AUREA PYRAMIDALIS.

Those who know the "golden glories" of this stove annual will agree that no one who has much late autumn and winter demand for sitting room and dinner-table decoration, as well as cut flowers, should be without it. There are many spurious and unsightly varieties of this vended and cultivated, and the true variety is comparatively scarce. On this account it would be well, when the true variety turns up, to destroy, as soon as they appear, all spurious sorts, and carefully save seed from the good and true; and when this practice is followed, the right variety can be constantly reproduced. I have grown golden pyramids of this 3 feet high in 10 and 11-inch pots, which resembled, in all but colour, a tower of ostrich feathers.

Its cultivation is very simple: sown in March in stove heat, and pot singly when 2 inches high, and shift as required into pots varying from 8 to 12 inches according to the sized plant desired, using a compost of equal parts loam and leaf

mould, with a little sand added. This, and a stove temperature in a light place, with frequent syringings on fine afternoons till it begins to bloom, is all that is of importance in its culture; and when in bloom it stands conservatory temperature, and lasts in bloom a long time. When the seed ripens it should be carefully looked after, or it drops out of the husk and is lost. This, and its crimson varieties, are of great service for autumn and winter display; and they bloom just at a time after most autumn things are over, and before late winter things come in.—(The Gardener.)

CHIRYSANTHEMUMS IN THE ORCHARD HOUSE.

I would strongly recommend the possessors of orchard houses not to neglect to brighten them up during dark November by the liberal use of these invaluable flowers. They are cheap to buy, easy to cultivate, and, when grown under glass, present a striking contrast to their brethren in the open air soddened with rain and disfigured by frost. With the assistance of a mat in very severe weather they succeed almost as well in an orchard house as in a greenhouse. Crimson Velvet, Jardin des Plantes, and Virgin Queen might challenge all the stoves in England to produce three flowers which equal them in brilliancy and contrast of colour. Another good quality of the Chrysanthemum is its persistence, whether on the plant or when cut. I have now before me a vase filled with flowers gathered a week ago, and still fresh.—G. S.

NEW BOOKS.

L'Art de Greffer les Arbres, Arbrisseaux et Arbustes Fruitières, Forestiers, ou d'Ornement, pour les multiplier, les former, ou les mettre à fruit. Par CHARLES BALTET. Paris: Victor Masson et fils.

This is just such a book as one would expect to emanate from the hand of so experienced a practitioner as Mr. Charles Baltet, who in himself constitutes one of those rare combinations of a successful cultivator and skilful writer on French horticulture. The subject on which this new work of Mr. Baltet treats is one which receives much more attention, and enters far more prominently into the horticultural practice of our neighbours than it does with us. With the exception of the ordinary whip-grafting, crown-grafting, inarching, and budding, there are no other varieties of this mode of propagating or of reconstructing trees practised among us; but with the French, for many years, the various modes of what we call grafting are so numerous, and attended with so much detail, that various works have been written on this subject alone.

The work before us consists of 320 pages, and is copiously illustrated with 113 well-executed woodcuts, representing the different operations, the instruments employed in executing them, and the results arrived at by the completion of the processes. To the English gardener there will be found in it much that is novel and instructive; and although our taste has not yet taken us in the direction of the fanciful shapes which the French have of late years given to their fruit trees, those who are interested in the subject will here find some examples of these, and the modes of forming them.

The following extract will supply information new to many of our readers:—

"The expense occasioned by the purchase of wool and cotton in nurseries (for grafting) has caused a search for ligatures of a more economical description. After having tried the leaves of Sedge (*Carex*), and Bullrush (*Scirpus lacustris*), one is attracted by two aquatic plants which grow abundantly on the borders of rivers and ditches, in ponds and marshes—the Cat's-tail (*Typha latifolia*), and the Bur-reed (*Sparganium angustifolium*). These are equally useful as a ligature. These two species belong to the family Typhaceæ. The plant is gathered when fully grown, either in the end of the summer for grafting in the year following, or in the spring, to be used in the course of the same year. The leaves, which are attached together at the base, are separated, and placed to dry in the shade or in a barn, by hanging them up in bundles tied together by their tops. When the time of using them arrives, they are cut into the required length, averaging 15 to 20 inches in length. A little before grafting the bundles are steeped in water for a few hours, and then drained by pressing them with the hand or by wringing them. Frequently it is sufficient to place them in a cellar to keep them fresh, and in grounds where there is no water they are put into the earth.

"This vegetable ligature requires a proper medium of dryness and humidity. Too dry, the leaf lacks resistance and breaks; too damp, it causes the decay of the graft and breaks also. The leaf is generally broad enough to be split up throughout its length. It bends better

when it is applied edgeways and not flat, and when it is slightly twisted. With the exception of grafts that require the wood of the stock to be cleft, and for which the leaves of the Cat's-tail and Bar-reed have not sufficient tenacity, we recommend this ligature for the majority of the processes of grafting."

We highly commend this work. It is thoroughly practical, and written by a gentleman of ability, who is completely master of the subject on which he treats.

Mouvement Horticole de 1867: Revue des progrès accomplis dans toutes les branches de l'Horticulture, avec Travaux mensuels pour 1868. Par Ed. ANDRÉ, Jardinier principal de la Ville de Paris. Paris: Goin.

THIS "Mouvement Horticole" is what may be called in English a Horticultural Year-Book, or record of progress, and has been carried out by M. André in a way which renders the work one of great utility. It is written in the form of essays or treatises on all the new discoveries in the various branches of horticulture, embracing not only the new plants, flowers, and fruits, but also new modes of culture and new principles. We have also notices of all the new books on botany and gardening that have appeared throughout the year, and a very lengthened report of the various series of the Great Exhibition of Horticulture at Paris in 1867.

This is an exceedingly useful book, furnishing a readable and entertaining record of all the great movements that have taken place in the world of horticulture during the past year; and we sincerely hope we may have a continuance of it annually.

LIVERPOOL WINTER FLOWER AND FRUIT SHOW.

ON the 24th and 25th of November this exhibition was held in St. George's Hall, and it was certainly the finest horticultural show ever held in Liverpool. The Chrysanthemums were the finest and best-grown specimens ever seen at any previous exhibition either in London or any other place. I was very much pleased to see such a marked improvement in the growth of the plants, the colour and size of their flowers, and more especially in their arrangement on the exhibition stages. The Liverpool gardeners had evidently profited by a few hints given them last year. The plants exhibited by Mr. Fleming, gardener to R. Houghton, Esq., were remarkably fine. The nine plants which took the first prize in Class 2, for the best nine large-flowered varieties, were the best lot of Chrysanthemums ever set up. In this opinion I am borne out by the venerable Chrysanthemum King, Mr. Broome, of the Temple Gardens. The flowers and foliage on all of the plants exhibited by Mr. Fleming were perfectly fresh and healthy, and the number of flowers on each of the nine plants exhibited in Class 2 would average 150. Mr. Wilson was also a very successful exhibitor, as were Mr. W. Lowndes, Mr. Dunbar, Mr. Airey, and Mr. Wood. There was a very marked improvement in the cut flowers, and the bouquets were a very great improvement upon those of last year. There was a large number of exhibitors in the classes set apart for these, and amongst so many really handsome and tastefully arranged bouquets it must have been extremely difficult for the judges to decide which really was the best, but I thought they were quite right in awarding the prizes as they did, for there was a greater degree of gracefulness about those exhibited by Mr. R. J. Smith and Mr. Freeman in the gardeners' class, and those of Mr. Rylance and Mr. Delamere in the nurserymen's or market gardeners' class, than in those which came from the other exhibitors. The flowers they contained were very choice and good. Many of the competitors still crowded their bouquets too much, a fault I pointed out to them in the report of last year's show.

The Hall was very tastefully decorated with Palms, Ferns, and fine-foliaged and flowering plants, which were arranged in the centre of the tables, and gave a good finish to the whole, and also very much improved the appearance of the fruit, which was arranged on each side of them on two of the tables, the other being set apart for the Chrysanthemum blooms. Primulas, Ericas, and the Chrysanthemum plants were arranged at the sides and ends of the Hall. A very large company assembled to witness this grand display of flowers and fruit, the weather being very favourable.

The fruit was of first-rate quality, and a large quantity was exhibited. The dish of Coe's Late Red Plum, exhibited by Mr. Freeman, gardener to the Earl of Derby, was in splendid condition. The Grapes exhibited by Messrs. Meredith, Hill, Smith, Sorley, Freeman, Wilson, and others were very fine, as were also the Pears and Apples which came from Mr. Sorley, Mr. Rylance, and several other exhibitors. Those shown by Mr. Sorley, gardener to Mrs. Zwilchenbart, were remarkably good both in size and quality.

There were some bunches of the true Tynningham Muscat, exhibited by Mr. Lees, of Tynningham. These, however, were not for competition. Mr. Lees told me this variety was very much superior to any other Muscat, as it set so freely. The berries were

certainly very regular, the bunches of good size, but a little past their best, a few of the berries being a little shrivelled. Mr. Pilkington, of Eccleston Hall, exhibited four splendid Montserrat Pines, very handsome, and weighing about 4 lbs. each; and the fruit of Smooth-leaved Cayenne Pine, for which Mr. R. Smith, of Calderstone, was awarded the first prize in Class 41, was very fine, weighing upward of 7 lbs., and being very handsome. I had afterwards an opportunity of seeing the house from which Mr. Smith cut this fine Pine. It is certainly one of the best houses of Pines I have seen for some time. There is a long row of Smooth-leaved Cayennes in this house, all having fruit in various stages, which will average about the same weight. These and some other matters at this neat and well kept place, I shall take another occasion of referring to. I also had an opportunity of seeing the fruit-room of Mr. Sorley, of Aigharth, and was much surprised by the magnificent collection of Pears. Mr. Sorley's name will be familiar to some of the readers of this Journal, he having frequently contributed interesting articles. The Grapes, evergreens, and general neatness of the place were very creditable.

I also visited several other places, and found them in very neat trim, all of them having fine displays of flowers, fruit, and vegetables. The Liverpool gardeners are, as a body, proverbial for neatness, industry, and respectability. They are also a very intelligent body, as was plainly visible at the meeting which was held on the Wednesday evening in one of the large rooms in St. George's Hall, where the Committee of the Liverpool Horticultural Society had prepared a very handsome collation for the exhibitors, which was served in a very substantial way, the drinking portion being tea and coffee. Afterwards some very interesting papers were read, and several good speeches made. A scheme was also proposed for the development of a society for the moral and intellectual improvement of the Liverpool gardeners. The room was crowded, and the attention of the whole body of gardeners present was riveted on the speakers for upwards of three hours; and, if I may judge from the friendly buzz of conversation which was heard at intervals, all were highly pleased, and appeared highly delighted that so good an opportunity had been provided by the Committee for them to converse, and socially to impart to each other their various successes and reverses. This is, without doubt, a step in the right direction, and one calculated to do a vast amount of good; and if horticultural societies generally would only adopt a similar means of bringing their exhibitors together, and meeting them in such a friendly and social way, it would promote a very genial reciprocity of feeling between them, which must be attended with the very best results.

In the course of the evening a very handsome gold-mounted walking-stick was presented to Mr. Broome, of the Temple Gardens, by the Committee, in recognition of the services he had rendered to the Society. They felt that they were indebted to Mr. Broome for a large amount of the success which their Society had attained, in consequence of his having, a few years ago, taken down to Liverpool two or three well-grown specimens of his favorite flower, and explained his mode of cultivation in a way so interesting and straightforward that the Liverpool gardeners at once set to work, and have now produced a show of these valuable autumnal flowers, such as has never before been witnessed, and which Mr. Broome, their veteran teacher, told them had never been surpassed nor, indeed, equalled. In acknowledging the handsome presentation (which was totally unexpected by Mr. Broome), he reviewed the whole history of his journey, through a period of upwards of forty years, in company with the Chrysanthemum, and the amount of information conveyed to all present cannot fail to be productive of much good to many, if not to all, of his hearers, and he was listened to with the utmost attention.

I may mention, in conclusion, that the Liverpool Horticultural Society is self-supporting, and that it does not depend upon any capricious donations or subscriptions from anyone. The prize schedule is formed, the date is appointed on which the exhibition is to take place, the various subjects are arranged in the noble Hall on the day appointed, and, as soon as the judges have performed their duty, the doors are thrown open to the public, who abundantly show by their attendance how much they can appreciate, and how willing they are to support, a society which, by the skill of a large body of expert gardeners, is able to produce such a grand display. If such a fine result as this can be produced in Liverpool, and be made self-supporting, why is it not done in London?—J. WILLS, F.R.H.S.

The following is a list of the prizes awarded:—

LARGE-FLOWERED CHRYSANTHEMUMS.—*Nine:* First, Mr. Fleming, gardener to Mr. R. Houghton. Second, Mr. Wilson, gardener to Mr. J. E. Reynolds. Third, Mr. Myers, gardener to Mr. R. Higgin. *Six:* First, Mr. Fleming. Second, Mr. Newman, gardener to Mrs. Holt. Third, Mr. Wilson. *Three:* Second, Mr. Lowndes, gardener to Mr. S. S. Parker. *One:* First, Mr. Wilson. Second, Mr. Fleming. Third, Mr. Dunbar, gardener to Mr. F. C. Braun. Extra, Mr. Airey, gardener to Mr. J. McArdle.

POMPOUS CHRYSANTHEMUMS.—*Nine:* First, Mr. Fleming. Second, Mr. Wilson. Third, Mr. Wood, gardener to Lieut.-Col. Wilson. Extra, Mr. Orr, gardener to Mr. H. Pearce. *Six:* First, Mr. Airey. Second, Mr. Orr. Third, Mr. Wood. Extra, Mr. Shaw, gardener to Mr. P. M. Hannay. *Three:* First, Mr. Wilson. Second, Mr. Lowndes, gardener to Mr. S. S. Parker. Equal, Mr. Myers and Mr. Woollam, gardener to Major Bindell. Third, Mr. Airey. Equal, Mr. Dunbar & Mr. Orr. *One:* First, Mr. Fleming. Equal, Mr. Myers. Second, Mr. Wilson. Third, Mr. Orr. Equal, Mr. Lowndes and Mr. Woollam.

ONE STANDARD CHRYSANTHEMUM.—First, Mr. Airey. Second, Mr. Wilson. Third, Mr. Dunbar. Extra, Mr. Airey.

ONE PYRAMID CHRYSANTHEMUM.—First, Mr. Wood. Second, Mr. Wilson. Third and Extra, Mr. Dnohar.

ANEMONE FLOWERED CHRYSANTHEMUMS.—Three: Second, Mr. Shaw. One: First, Mr. Wilson. Second, Mr. Shaw.

CUT BLOOMS, LARGE-FLOWERED CHRYSANTHEMUMS.—Eighteen: First, Mr. Hobbs, Bristol. Second, Mr. Foster, gardener to Mr. S. H. Thompson. Third, Mr. Tiller, gardener to Mr. J. Crossfield. *Twelve*: First, Mr. Hobbs. Second, Mr. Foster. Equal, Mr. Dunbar. Third, Mr. Tiller. *Size*: First, Mr. Hobbs. Second, Mr. M'Hardy, gardener to Mr. J. G. Bateman. Equal, Mr. Dunbar. Third, Mr. Foster.

SIX FRINGED PRIMULAS.—First, Mr. Shaw. Second, Mr. Airey. Third, Mr. Myers.

FOUR DOUBLE PRIMULAS.—First, Mr. Sorley, gardener to Mrs. Zülchenbirt. Second, Mr. Airey.

STOVE AND GREENHOUSE FERNS.—*Size*: First, Mr. Armstrong, gardener to Mrs. Hadwen. Second, Mr. Sinclair, gardener to Mr. R. Alison. Third, Mr. Tharia, gardener to Mr. Joseph Mayer. *Three*: First, Mr. Armstrong. Second, Mr. Sinclair. Third, Mr. Wilson. *One*: First, Mr. Sinclair. Second, Mr. Armstrong. Third, Mr. Woolham.

TREE FERN.—Prize, Mr. Freeman, gardener to the Earl of Derby.

STANDARD MIGNONETTE.—First, Mr. Lamb, gardener to Mr. P. S. Boulton. Second, Mr. Lowndes. Third, Mr. Wilson.

MIGNONETTE.—First, Mr. Lowndes. Second, Mr. Lamb.

COQUET FOR THE HAND (Gardeners).—First, Mr. Fleming, gardener to Mr. R. Houghton. Second, Mr. Freeman. Third, Mr. Eaves. (Nurserymen and Market Gardeners).—First, Mr. Iyance. Second, Mr. Delamere. Third, Mr. Ashcroft.

POINSETTIA PULCHERRIMA.—Three: First, Mr. Dunbar. Second, Mr. Titherington, gardener to Col. Thompson. Third, Mr. Everett, gardener to Mr. John Campbell.

ROMAN HYACINTHS.—Three Pens: First, Mr. Dunbar. Second, Mr. Newman, gardener to Mrs. Holt.

EUPHORIA JACQUINETFLORA (Three Pots).—First, Mr. Freeman, gardener to the Earl of Derby. Second, Mr. Everett, gardener to Mr. John Campbell. Third, Mr. Porteous, gardener to Colonel Clay.

THREE ORNAMENTAL FRUITED PLANTS.—First, Mr. Shaw. Second, Mr. Freeman. Third, Mr. Foster.

THREE ORNAMENTAL-FOLIAGED PLANTS.—First, Mr. Sinclair, gardener to Mr. R. Alison. Second, Mr. Newman. Equal, Mr. R. H. Smith, gardener to Mr. H. Walker. Third, Mr. Everett, gardener to Mr. John Campbell. Equal, Mr. Woolham.

HEATHS.—Three: First, Mr. Shtw. Second, Mr. Freeman.

PALM.—First, Mr. Freeman, gardener to the Earl of Derby. Second, Mr. Tharia, gardener to Mr. Jos. Mayer. Third, Mr. Wood. Extra, Mr. Tharia.

FRUIT.

TWELVE DISHES OF HARDY FRUIT (Nurserymen).—First, Mr. O. Ryance, Town Green. Second, Mr. R. Ashcroft, West Derby. (Gardeners).—First, Mr. Sorley. Second, Mr. Woolley, gardener to Mr. Jackson, M.P. Third, Mr. Smith, gardener to Mr. H. Littlede.

SIX DISHES OF FRUIT.—First, Mr. Freeman. Second, Mr. Hill, gardener to Mr. R. Sneyd. Third, Mr. Sorley.

PINE APPLES.—Three: First, Mr. Wallis, gardener to Mr. J. Dixon. Second, Mr. Porteous, gardener to Col. Clay. *One*: First, Mr. R. H. Smith, gardener to Mr. H. Walker. Second, Mr. Wallis. Third, Mr. Freeman.

GRAPES (Black Hamburgh).—First, Mr. Wilson. Second, Mr. Smith. Third, Mr. Woolley.

GRAPES (Black).—First, Mr. Ellis, Houlgrave, Seaforth. Second, Mr. Smith, gardener to Mr. Littlede. Third, Mr. R. H. Smith.

GRAPES (White Muscat).—First, Mr. Hill, gardener to Mr. R. Sneyd. Second, Mr. Forbes, gardener to Mr. J. A. Timm. Third, Mr. R. H. Smith.

GRAPES (White).—First, Mr. Smith. Second, Mr. Williamson, gardener to Mr. T. C. Clarke. Third, Mr. Freeman.

PEARS (Dessert).—Eight Varieties.—First, Mr. Ancherlonie, gardener to Mrs. Harvey. Second, Mr. Sorley. Third, Mr. Orr. *Four Varieties*: First, Mr. Lowndes, gardener to Mr. S. S. Parker. Second, Mr. Sorley. *Best Dish*.—First, Mr. Turner, gardener to Mr. Edward Bates. Second, Mr. Foster. Third, Mr. R. H. Smith.

APPLES (Dessert).—Four Varieties: First, Mr. Smith. Second, Mr. Turner. Equal, Mr. Lowndes. Third, Mr. Barnett, gardener to Rev. W. B. Motfeld, Shiffhall. *Best Dish*: First, Mr. Lowndes. Second, Mr. Turner. Third, Mr. Foster.

APPLES (Culinary).—Eight Varieties: First, Mr. Turner. Second, Mr. Ancherlonie. Third, Mr. Freeman. *Four Varieties*: First, Mr. Woolham, gardener to Major Blundell. Second, Mr. Titherington. Third, Mr. Orr. *Best Dish*: First, Mr. Woolham. Second, Mr. Thompson, gardener to Mr. R. L. Bolton. Third, Mr. Orr.

EXTRAS.

BASKET PLANTS.—One: Prize, Mr. Newman, gardener to Mrs. Holt.

COLLECTION OF FRUITS.—Prize, Mr. Charles Iyance.

RUSTIC STAND OF FLOWERS.—First, Mr. Wade, gardener to Mr. R. Duke. Second, Mr. Lowndes.

COLLECTION OF GOURDS.—Prize, Mr. Jones, gardener to Mr. H. Duckworth.

TYNNINGHAM MUSCAT GRAPES.—Prize, Mr. Lees, Tynningham.

THE ROYAL ASCOT GRAPE.

Is the Royal Ascot a late-keeping Grape? Does it set its fruit as freely and bring it to perfection in the same medium temperature that the Black Alicante and Lady Downe's do? And is it equal in size of bunch and berry to the above popular varieties? Some say it possesses every quality that a good late Grape ought to have, while others deny that this is the case. Now, I am about to plant twenty-six Vines of late-keeping sorts, and should like to include the Royal Ascot, but in the absence of more substantial information than mere opinion, I hesitate to do so. Actual proof is wanting, and if any correspondent who possesses the required information will

have the kindness to impart it through the medium of this Journal, he will oblige many others as well as—THOMAS RECORD.

TRAINING WALL TREES.

I OFFER a suggestion to my brother learners respecting the training of Peach and other wall trees. It is one resulting from a seven-years trial, with such comfort and success as lead me to hope it may prove acceptable to those for whom I write.

One wall in my garden, with a S.W. aspect, is unfortunately built with limestone, presenting an uneven surface, with stones of impracticable size. Zinc wires strained horizontally, which was my first remedy, fretted the bark, old and young, so much, that I had it removed as soon as circumstances would permit. After other ineffectual attempts I tried slips of white deal timber, half an inch by three-quarters inch, the latter being laid against the wall at intervals of 6 inches, and secured (but not nailed), to it in the following way. I ordered some "sprigs," from my nailer, to be made with longer "spuds" than they usually have—spuds are projections on one side of the head of this kind of nail—which I had made about half an inch long, the nails being 2½ inches long and a little stronger than common sprigs of that length. Five of these were sufficient to secure each slip of timber—viz., three below and two above in quincunx order. The slips are 8 feet in length, and two of them in a continuous line from the centre of the tree form the extent, 16 feet, which I can afford to each tree. It will be understood that the sprigs are not driven through the timber, which only rests on the lower ones, and is secured by the projecting spuds above and below, as shown in the accom-

panying engraving, by which means there is a spring in the timber, which greatly facilitates the tying with Cuba matting, no shreds of cloth or other material being needed or admissible, for when saturated with moisture that becomes suddenly frozen they are destruction to the bark of the young shoots, and injurious even to the matured wood.

I had occasion lately to move one of my trees trained in this way, and having removed the two upper nails over each slip, and perfectly freed the roots, the whole framework readily moved upwards, without disturbing a single tie, shoot, or branch; and my man Friday and I carried it (as he said), "body and bones" to its new site against a brick wall, and secured it as before. The angles of the timber being planed off, as appears on the very rough sketch which I have given above, the slips moved freely from the nails, and the young spray had still a bearing of nearly half an inch on the smooth, flat surface of the slip or lath, which had been previously painted, tacking a dozen or more together at the ends to other slips, so that the paint brush could just act between them, the lot being turned over to paint the backs when the fronts were finished. The cost is trifling compared even to wire, and the timber as sound after seven years' use as when put up. Should woodlice or earwigs, &c., hide between the slips and walls, pressure here and there on the slips soon settles their fate.—O. R. O.

ORANGE CULTURE IN FLORIDA.

MILLIONS of acres of the best land in Florida are covered with groves of the wild Orange. How these groves originated is a mooted question. Some suppose that the tree is indigenous on the peninsula; but as no mention is made of it by the narrators of the early Spanish exploring expeditions, and as it is a matter of history that the Orange was introduced by the first colonists nearly three hundred years ago, it seems probable that it is of foreign origin, especially as the fruit is known to deteriorate very rapidly and to return readily to its natural wildness, seedlings of the best varieties generally proving worthless. Be their origin what it may, the present existence of

these groves has an important bearing upon the prosperity of the State, as we shall see.

The wild Orange of Florida is of two kinds—the sour and the bitter sweet. Neither of them is palatable. The tree is very beautiful—far more beautiful than the cultivated varieties—and exceedingly productive. A grove loaded with its golden fruit is a sight one may afford to travel hundreds of miles to see.

The Sweet Orange has been cultivated in Florida almost from the first settlement of the country by the Spaniards, in the sixteenth century, but has not till lately become a prominent interest. The earliest groves were at St. Augustine—our “Ancient City”—and constituted for a long time almost the only source of income possessed by the inhabitants. In February, 1835, the “great frost,” as it is called, killed every tree to the roots; and not only every Orange tree but every fruit tree of all kinds in East Florida north of the twenty-ninth parallel of latitude.

Groves subsequently planted at St. Augustine and elsewhere were attacked by the scale insect (*Coccus hesperidum*), and most of them rendered worthless.

Within the last ten years there has been a revival of the interest in the Orange culture. The scale insect seemed to have ceased its ravages. The groves planted since 1858 have, where any tolerable degree of attention in the way of cultivation has been given them, flourished finely. In fact, some of them are now bearing heavily under almost total neglect.

It is not true, as some have asserted, that the scale insect has disappeared. It is still present in many if not in all groves, but it seems no longer to be capable of its former destructiveness. At any rate, trees planted in suitable soil and properly cultivated do not now suffer in any appreciable degree from its presence, and some of the old groves formerly ravaged by it and rendered unproductive, are now again in bearing.

The cost of planting an Orange orchard must vary greatly in different localities, depending partly upon the original condition of the land and partly upon the expense of getting the trees from the wild grove. Formerly the wild trees were considered as free to everybody, and people wishing a few to plant dug wherever they pleased; but now they are beginning to have a market value. It is not in all cases convenient or possible for a person to buy land with wild groves on it. A certain sum, then, must be allowed for stocks.

One gentleman with whom I am acquainted, and who has already planted several acres, estimates the cost in his case as only 25 dollars per acre. He does not, however, include the cost of clearing the land. I estimate as follows for ten acres of fresh hammock land with its natural forest growth upon it:—

	Dollars.
Cost of ten acres at 10 dollars per acre	100
Clearing and preparing	250
Inclosing with rail fence	200
1000 trees at 25 cents each	250
Planting and budding	100
Incidental	100

Dollars 1000

The use of the ground for other crops will fully pay for all the cultivation the grove will require for the first three years, after which there will be an income from the grove itself.

With regard to the productiveness of the Orange tree, it is impossible at present to arrive at any very satisfactory conclusion. This is partly because there has been no systematic mode of culture pursued, and the real production has varied greatly in different groves; but mainly because people in Florida never weigh, measure, or count anything, and really have no idea how many Oranges one of their trees produces. Some of the old trees at St. Augustine are said to have produced annually at least 8000 Oranges each. Mr. C. F. Reed, of Mandarin, on the St. John's River, gathered 12,000 from three trees last year, one tree bearing 3200, another 3300, and the third 5500. I have been told that thrifty trees sometimes bear as many as 1000 Oranges the third year from the bud, but such productiveness I think must be rare. The conclusion I have arrived at, from personal observation, is that a well-planted and properly cultivated grove at ten years of age will average 2000 Oranges per tree. Taking one half of this, however, as a basis of calculation, ten acres will produce 1,000,000, which, at 25 dollars per thousand, the lowest price of the last season in Jacksonville, amounts to 25,000 dollars. The crop of the present season has in some cases been bargained for in advance for 25 dollars per thousand at the grove.

Florida Oranges are the best in the world, and will always

command the highest price in all markets. Some of the best were sold in Jacksonville during the last winter as high as 50 dollars per thousand.

It should be observed here, that north of the twenty-eighth parallel of latitude, crops are occasionally cut off by frost; but a total failure from this or any other cause is rare.—D. H. JACQUES (*The American Horticulturist*.)

WORK FOR THE WEEK.

KITCHEN GARDEN.

DRAINING, trenching, and digging, should now be carried on with vigour, and the ground, if naturally heavy, should be thrown up in ridges, when a greater surface will be exposed to the ameliorating and pulverising influences of frosts and thaws. Compost heaps should be frequently turned over during frosts. The planting of vegetable crops should now merely be confined to a few sorts of *Cabbages*, *Coleworts*, and late *Celery* for soups. *Cauliflower* and *Lettuce* plants in frames and under handlights, to be protected with mats, or long litter, in frosty weather. The hoe may be used occasionally in dry weather to destroy weeds between the rows of vegetables, and to draw earth to the stems of late *Broccoli*, *Cabbages*, &c.

FRUIT GARDEN.

Although November is the preferable month for planting and pruning fruit trees, if, owing to any of the many causes for delay, these operations were not carried into execution, I would strongly advise commencing such work as soon as possible, in order to finish it while this open weather lasts. In cases where several branches of a tree have become so luxuriant as to prevent a fair distribution of sap, or where the growth has been so rampant as to prevent the formation of blossom buds, the cutting of the stronger roots, so as to check the too luxuriant branches, or the general pruning of the roots in cases of too vigorous, though uniform growth, will be attended with advantage, inasmuch as vigorous growth and fruitfulness are severally promoted by means directly the opposite of each other. Though root-pruning is now frequently referred to as something new, it is nearly thirty years since I saw it resorted to, and then it was not thought anything remarkable for novelty. The practice, frequently recommended, of cutting the roots every year or so, and then surrounding them with a trenchful of rich manure, though, no doubt, attended with good results, possesses this anomalous feature, that the system owes the whole of its success to a perpetual doing and undoing, producing fertility by rendering the tree deficient in nourishment at one time, and supplying it with too much at another. When trees are deficient in fertility from over-luxuriance, I should prefer the raising of the roots nearer the surface, giving no manure but as mulching, and attending to early and judicious summer pruning, rather than a yearly mutilation of the roots, unless in circumstances where it was desirable to have as many fruit-bearing trees upon as small a space of ground as possible. Where the roots of Apples, Pears, &c., are within from 9 to 18 inches of the surface, the trees may soon be deprived of extra luxuriance by judicious summer pruning, merely preserving as many leaves on the shoots as will insure a healthy action between the roots and the branches, and not so many as will shade those buds at the bases of the shoots, and on small spurs, that can only be rendered fruitful by a free exposure to light and air. In extreme cases, as in fine old Pear trees that have become barren in the centre, the raising of the roots, and supplying the tree with young wood, would, doubtless, be attended with good results; but with trees of moderate age and equality of growth, it will seldom be necessary, unless in the case of trees of peculiar habit.

FLOWER GARDEN.

This being about the best time for procuring a few Roses for the flower garden, those who are desirous of collecting a small group of good sorts, should obtain the following, which are mostly Perpetuals, or which flower from June until late in the autumn, when frost puts an end to their beauty—viz., *Acidalie*, *Bouquet de Flore*; **Duchess of Sutherland*, **Madame Laffay*, *Auberson*, **Fulgore*, *Duc d'Aumale*, *Bernard*, *Crimson Perpetual*, *Prince Charles*, *Bongère*, *Goubault*, *Elise Sauvage*, *Comde de Paris*, *Triomphe du Luxembourg*, *Sylvain*, **Lady Fordwick*, **Lamarque*, and **Jaune Desprez*. The above are good, and not expensive to buy. Those marked with an asterisk (*) are well adapted for covering walls, or for training up pillars, &c. If planted in a bed they had better be placed in the centre,

or wherever it is wished that the bed should be highest. China, Tea, and Noisette Roses, should be kept in pots till the spring. Other kinds may be planted with advantage about this season, when the weather is dry and not frosty. The florist may now take breath. His Tulips are all safely in the ground, and in a growing state, and, comparatively speaking, out of harm's way. The Carnation grower's chief care must now be to prepare his compost for next season. His turf must be turned often, very often, during the next three months, carefully picking out of it the florist's plague, the wireworm. His leaf soil also must be shaken up and sweetened, and a proper quantity of thoroughly decomposed stable manure must be made sure of, whatever other crop go without.

GREENHOUSE AND CONSERVATORY.

The only attention required now for greenhouse plants is to keep them free from damp, by having the house well aired, and all dead leaves removed. Stir the soil in the pots occasionally, and use as little water as possible. *Euphorbia jacquiniiflora* is an excellent conservatory plant while it is in blossom, but at other times it must have stove treatment. Last season about this time some large plants of it were pruned, to see if by a little forcing in spring they could be induced to flower early this winter, but the experiment failed in some measure; as soon as the plants began growing in spring, they also flowered on the young growth, but not satisfactorily, and now they are not more forward than others that flowered last Christmas, and that were pruned in January.

STOVE.

The highest night temperature in the stove for this month should not exceed 60°, which may be maintained as long as the weather keeps open; should the weather, however, suddenly change to hard frost, do not strive to keep up this temperature by strong fires; 50° will be high enough in very severe weather, and strong fires will not be needed, even to keep up that heat, so that in many cases water must be sprinkled over the paths, pipes, &c., to prevent the highly dried air from injuring the plants. Strong stove climbers that do not blossom freely should now be root-pruned, by cutting off some of their largest roots near the surface, or if they are to be taken up next spring and tried in boxes, this is a good time to begin to prepare them, not, however, by cutting their roots, but by tracing one half of them to their extremities, and then placing them near the surface, with some light compost thrown in amongst them. By the end of January these roots will have formed a fresh set of young fibres, and then the other half of the roots may be served after the same manner, but leaving the plant in the same place till later in the spring. This is a safe mode of treating plants that are to be removed from the borders of any of the houses, or for checking their luxuriance.

PITS.

Such a season as this proves how useful temporary structures are for protecting greenhouse plants late in the autumn; the general plan is to cram all the pits and houses on the first appearance of frost in October, whereas almost all the plants of this kind might yet be partially in the open air, and be much benefited by the treatment. For some families of plants, *Pelargoniums*, for instance, that are worked much out of season, pits and structures of the sort are particularly useful. To have fine specimens of *Pelargoniums* in blossom from August and September, October is the best time to cut down the plants, and from that time till after Christmas they should be as much exposed to the open air as rain and frost will permit; then they will only be coming into leaf again, and after two months' protection in the greenhouse, &c., they may be again turned out into temporary pits to keep them back, and as the warm weather comes, they may be placed under a north wall.—W. KEANE.

DOINGS OF THE LAST WEEK.

TIMELY HINTS.

Management of Fires and Flues.—We are told we ought to have been more explicit on this subject a few weeks ago, as many new readers have not back volumes to refer to, and since the humorous account given by "A. R. L.," at pages 354 and 355, telling how a flue that would not draw was made to burn well at last, we have had numerous questions about it, the most of which might at once have been put to the test of experiment, and the only one that needs an answer, is that referring to the remedy that is to be applied when there are no soot doors to open in order to light a fire.

Now, when a boiler is set over a furnace, and there is only a short flue to the chimney, there is generally no want of a good draught. Unless well managed, the draught would be strong enough to take three parts of the heat up the chimney, and send it out to heat the general atmosphere, a matter of importance to the person who has the fuel to pay for.

When a furnace has to heat a flue, whether the furnace is also to heat a boiler or not, it is a matter of first importance that the furnace grating or fire-bars should be from 24 to 36 inches below the bottom of the flue. If this matter is looked to, there will rarely be any difficulty as to quick draught, except where the flue is very long, has several turnings, or is damp inside, either from moisture percolating, or long disuse. A flue connected with a furnace that heats a boiler before the heated air goes into the flue, is more likely, if long, to draw slowly, because a good portion of the heat is absorbed by the boiler before it enters the flue. When heating by hot water, and the most is to be made of the fuel, it is well to have a flue in addition, instead of sending so much heat up the chimney. When a large boiler is used, a flue taken from it might thus heat a separate house. We have in our eye a conservatory heated in this way; a boiler and pipes, and a flue from the furnace, with three turns in the back wall, so that before the heated air reached the chimney it was tolerably cool. In this case, dreading the sour smoke that was sure to fill the stoke-hole at the first lighting, we generally chose a dry bright day for putting on the first fire in the autumn, and if that did not do, we just adopted the engineer's remedy, and put a fire in the flue, by taking out an iron smoke plate; excellent assistants in all flues, as thus the flue may be easily cleaned without breaking or knocking it to pieces.

In many other instances, where the flues were not very long, where there were no soot doors, and yet from not having a fire for many months, there was apt to be back smoke in the stoke-hole, we found a draught was at once secured by going to the chimney top, and lighting dry straw or shavings in it a few feet from the top; a few handspins generally did all that was necessary, as the air thus rarified drew the heavier air to supply the comparative vacuum, and the draught in the furnace was at once secured. As already stated, however, unless the flue has many turns, or is very long, the sinking of the furnace low enough will generally insure draught. We have known cases where chimneys were raised a couple of yards to get free draught, when the sinking of the furnace-bars 12 inches would have been more effectual. The only drawback to this, especially when the flues go beneath the floor of a greenhouse, is, that the stoke-hole must go all that lower, a matter of no great importance, except when water comes in the way, as then means must be taken by cement or otherwise to keep the place dry.

As regards the management of fires, we are not surprised to find, by these pages, that there are so many complaints about the quantity of fuel consumed in heating boilers, &c., because, in the first place, we have never yet worked a boiler that did not require more fuel to keep up a continuous heat than the purchaser was given to understand it would do. "Only see," says the vendor, "what a small supply of fuel will heat the water sufficiently," and so it may, but little or nothing will not keep it hot. We can well recollect in one case, how chaldron after chaldron of coke used to be grumbled at. There was never anything like the consumption of fuel before, no, never; but there was another no-never, never mentioned, that instead of being satisfied with Grapes in August, they must be had in the beginning of May. But not knowing all about this, we actually had all the huge clinkers broken up and pitched into the furnace a second time, until they came out like as much iron, and, determined to have something to burn, we used up lots of half decomposed caky dung fast approaching the peaty state, and obtained heat from it too; but the wind one night took the smoke and fumes to the windows, and after that there was no more talk about the waste of coke. But for that fortunate wind, we would soon have settled some waggon loads of the manure, of which there was no scarcity; but it was not the most pleasant thing to work among, and we were glad to let it alone. It made us do our stoking, however, with such care and circumspection that we could be satisfied no one who knew the facts of the case could say there was waste.

We have no doubt that complaints are often just, because there is waste either from ignorance or inattention, so much so, that in all places where there are many furnaces a good stoker is just another word for a good sayer, and especially in districts where coal is yet dear, or has to be far driven. So much is this the case, that for heating small houses, where a person

interested can see the work done, or do it, all our experiments prove that the best and dearest coal is also the cheapest; but an inferior coal will often be the most suitable, just because when an extra quantity is burned carelessly there will not be the same value lost as if it had been the best coal. Thus, also, as far as fuel is concerned, the heating a number of houses by one boiler will be the most economical, because there is only one chimney instead of many to take away the heat from the furnace.

In lighting a furnace fire, a little dry wood, straw, and shavings are as good as anything; and when burning, a little coal, such as nuts from the size of beans to walnuts, without dust, will generally take at once, and when fairly lighted other fuel may be added; but cinders, half-burnt coal, and coke do not ignite so quickly as these little bits of coal, which also should be rather dry. We are presuming that before lighting, the furnace is well cleaned out, and that if the ashpit is not cleaned out entirely that there should be sufficient space between the bars and the ashes to allow the air to have as much access as is desirable. Not so long ago we were asked our advice as to a furnace that would not draw a bit unless the furnace door stood open. The ashpit was as compactly crammed as if the cramming had been one of the essentials of management. In lighting, shut the furnace door and leave the ashpit door open, so that plenty of air may pass through the furnace bars to the lighted fuel. As soon as the boiler or flue is becoming heated, partly shut the ashpit door, and when hot enough shut it altogether, leaving only a small opening to allow as much air to enter as will keep up a slow, regular combustion of fuel.

For heating by flue alone we would have no damper in the flue, as it is liable to cause injury, but regulate draught entirely by the ashpit door, and if this is done by allowing only a small slit for air, the flue will be pretty warm and the chimney almost cold. When a furnace is used for heating a boiler only, and it is merely a few feet from the upright chimney, there should be the same attention to the ashpit door, but that will not be enough; a damper near the base of the chimney will also be required, to be drawn nearly out when lighting the fire, and until the heat is up, and put nearly in when the fire has become bright and the water hot enough. Sometimes a mistake is made by sending the damper right home; but any injury from this cause is easily prevented by having a hole, say 1 inch in diameter, in the centre of the damper. Whenever the heat is well up, and there is fuel getting into an incandescent state, it is always a true sign of bad management to see the damper out and the ashpit or furnace doors open. In the first case the heat escapes freely up the chimney instead of being sent back to, or more confined round, the boiler. In the second case a rapid consumption of fuel takes place by the free admission of air, and the open furnace door lets the heat freely out for the benefit of the neighbourhood. Of course when there is too much heat the opening of the furnace door and the shutting of the ashpit door will lessen draught, and what is desired takes place—the heat is gradually lessened, at the expense of wasting the fuel. Such things will happen in sudden changes of weather with the best stokers; but when these little matters are attended to in a sort of haphazard way, it is impossible that the most can be made of the fuel for heating.

In applying fresh fuel it is best to keep the incandescent fuel next the flue, and the fresh nearer to the furnace door. Much of the smoke is thus consumed, and the moisture in the new fuel is, if the fire is strong, also decomposed, and adds to the heat. Ashes and small dusty coal are best used after the fire is strong, and placed in the position indicated; and if such small dusty fuel be well watered before using, it will burn all the better, because it cakes as the heat takes the moisture from it. In practice we find that a small hole near the top of the furnace door for flues, and either there or in a soot plate not far from the boiler when hot water is used, tends to the lessening of the smoke, and so far to its consumption. A small stream of air, such as would have entrance from a hole from one-eighth to one-quarter of an inch in diameter, acts very differently from opening the furnace door. With the exception of small coal for lighting, we would if we could prefer coke for fuel, for besides being more under the control of the ashpit door and the damper, the outside appearance of the houses is less injured by smoke. Ere long in all large places the smoke will be carried to a distance. Much of it becomes a great eyesore in small places. We know of some scores of nice little glass houses that are unheated on account of the smoke, and as gas is not to be had; but even where it is so, if

not used carefully, it would be as injurious to plants as the frost.

We find that, so as to suit beginners, we have said nothing about banking up fires the last thing at night. A few ashes will generally be sufficient; but if the ashpit and furnace doors are properly attended to, there is little necessity for one getting his throat full of dry ashes. In greenhouses, unless in continued frosts, continued fires are seldom necessary. In many cases a brisk fire is all that would be needed. A great deal will yet be done with just one brisk fire, and the fire allowed to go out before lighting again. But in the case where a continuous regular heat is wanted by night as well as by day, the only true mode of management is to get the heat up by bedtime, and allow it to fall a little at night by a slow combustion. We have managed this regular heat very well in this way without dust or ashes: Instead of raking the bars as at lighting time, beat the fuel down on them, add the fresh which experience deems necessary, beat that gently, and shut furnace and ashpit doors, leaving only a small opening in the latter; a slit, 1 inch long and less than a quarter of an inch wide, will give enough air to play on the fuel thus pressed down. In the morning, when it is generally coldest in winter, a stout poker or crowbar run through such fuel, and the opening of the ashpit door, will soon give a bright fire.

Next in importance at present, is a very simple matter.

Watering.—Much of future success depends on the waterer. We have still a great portion of our bedding stuff in cold frames, and these old and none of the best. In such dull weather it requires a little management to keep plants from damping. Some things will become dry to their injury, moist and foggy though the weather be, and a careless waterer would do infinite mischief. Each pot should be carefully watered gently by the spout. In fact, the best plan is to lift the plants out, water them, let them drain, and then replace them. In greenhouses, similar care should be used. *Calceolarias* and *Cinerarias* need a considerable quantity of water, unless in the duldest weather; but both delight to stand on damp moss, and, therefore, may have their wants attended to without deluging other plants. *Chrysanthemums* will not do to be dry, but they are frequently kept too close and damp, and *Camelias* should be damp rather than dry. Everything will want water according to its growth, and the temperature and sunlight; but in all greenhouses now, no water should be spilled or splashed about, as in every change of weather that water is apt to rise as vapour, and in a frosty night be condensed against the glass, and in many cases come all over the plants as an ugly shower. Even in plant stoves, there is danger of too much water being spilt in such foggy weather, and where no means are used to prevent drip, as continuous planes of glass, tilted bars, or double roofs, the drip often does much injury. Where there are few incentives to dry soil in pots, where evaporation by foliage is pretty well met by absorption, water should be used with care, and none allowed to run to waste. In all such mild, dripping, foggy weather as we have lately had, there is more danger of plants being too wet than too dry.

Air-giving.—When cold and frosty, if we gave a little air, we should keep at that little, rather than give more, and as a consequence give more fire heat. In such mild, foggy weather, we should give a little fire heat where we could, so as to afford a little air top and bottom, to promote a free circulation. In frames and pits, where no artificial heat could be given, the sashes were tilted back and front, to admit air without much moisture. We find we must give more air than we have done to the pit of *Calceolaria* cuttings, as against our will they are striking root—those first put in—and we would rather they had been a few weeks later, as they will be more sensitive to frost, and especially as standing so thickly, and, therefore, we must keep them as robust as possible, so that they may not grow much. We like best when these bedding *Calceolarias* do not root much until after the shortest day is past; the mild weather has brought them on sooner than wanted, but they look very well now, with not a break in the thick lines.

Washing Glass.—Nothing will make up in such days for the want of clean glass. That over the *Calceolarias*, and much besides, was anything but clean. We have had a rather heavy job in washing lights inside and out, and especially inside. Smeared, clouded, dirty glass, is as unwholesome to a plant, as a dirt-encrusted window is to the dweller in the room, to which the window belongs. Like ourselves, plants rejoice in the light, and in such close, damp weather all that we can give them under glass will be little enough, especially to all our favourites that come from brighter skies than ours. It is well to treat a

plant so as to deserve its thanks, for, like a child, it has not learned deception, but will look bright or gloomy just as it is considerably and intelligently used.—R. F.

COVENT GARDEN MARKET.—DECEMBER 2.

A VERY free supply of English Pine Apples is coming in now, also some very good ones from St. Michael's, chiefly of the Smooth Cayenne variety. Vegetables are also plentiful and of good quality, the Broccoli especially; but we have a very indifferent report to make of Potatoes generally.

FRUIT.

TO CORRESPONDENTS.

. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

Books (Harry).—"The Modern Peach-Pruner," by Brühart, 3s. 6d.; "Heating," by R. Fish, 6d.; "The Cottage Gardeners' Dictionary," 6s. 6d.; and Johnson's "Science and Practice of Gardening," 3s. You can have them free by post from this office if you send in stamps, with your address, for the first, 3s. 6d.; for the second, 7d.; for the third, 7s. 2d.; and for the fourth, 3s. 4d. (A.R.).—London's "Hortus Britannicus" states the Latin names of plants. The "Cottage Gardeners' Dictionary" states the names of all worth cultivating.

GREEN GAZE NEAR A TOWN (J. A.).—It is this variety, and not Plums generally, that is spoken of in the passage you mention.

MAHALEB CHERRY STOCK (I. Reader).—The Mahaleb stock is a species of Cherry (*Cerasus Mahaleb*), and is raised from suckers, layers, and by sowing the stones. It is used as a stock for the Cherry because it dwarfs the trees, and on that account is very desirable, as the trees, as bushes and pyramids, can be grown in a small space, and they come into bearing much earlier than those on the wild Cherry stock.

FORMING PYRAMID CHERRY TREES (Idem).—Commencing with a maiden plant, the head should be taken off at 13 inches above the point of union of the graft and stock. This will cause the production of side shoots, the uppermost of which is to be trained as a leader, and all the others should have their points taken out as soon as they have made six leaves, commencing with the strongest and ending with the weakest; when the shoots push again, take out their points at the third leaf. The leader may be stopped when it has grown 12 inches, and it will push one or more shoots. One is to be trained as a leader, and the others should have their points taken out at the third leaf. In winter the leader should be cut back to within about 15 inches of the last stopping, and any of the side shoots that are irregular may be shortened so as to have the tree widest at bottom and gradually tapering upwards. As respects the leader the treatment is the same in the following year, and afterwards, until the desired height of tree is attained, and the side shoots are allowed to make shoots with six leaves; then take out their points, keeping them closely pinched-in afterwards to one or two leaves. Care

must be taken to stop so as to form a perfect cone or pyramid, encouraging the shoots in the hollow places, and not stopping them until they are of equal length with the others, and when they are too prominent pinch more closely. Pyramids on the Mahaleb stock may be planted 4 feet apart, so that 2722 will be required to plant an acre. At that distance biennial lifting is not necessary, but it will answer very well. We plant ours 6 feet apart, and only move them when they become too vigorous, which is about every third year. At 6 feet apart 1210 trees are required for planting an acre.

CLIMBERS FOR FERNERY (Subscriber).—If you are erecting a fernery at the back of a wall which will give the fernery a north aspect, few climbers will succeed in such a house, as it will not receive much sun. We can, however, recommend *Lapageria rosea* for the roof, and the back wall we would have made to hold plants, and plant some of the *Davallia*, as *D. dissecta*, *D. canariensis*; *Drynaria pustulata*, *Acrostichum bipinnatifidum*, *Nephrolepis tuberosa*, *Niphobolus rupestris*, *Platyneuron alciornum*, which will grow if properly supplied with moisture; and their rhizomes grow over the wall, being very pretty if intermingled with *Selaginella denticulata*. *Lygodium scandens* is a handsome climbing Fern, and will succeed in a greenhouse temperature, and so will those named. You could not introduce flowering plants into such a house advantageously.

SOWING SEEDS FROM AUSTRALIA (J. M. T.).—The seeds should be sown at the end of February or beginning of March, in sandy peat two parts, and one part light turfy loam, covering them with soil equal in thickness to the thickness of the seeds. Place them in a hotbed, plunge the pots to the rim, and maintain a temperature at bottom of about 75° or 80°, and a top heat of from 65° to 70°, with a rise from sun heat. They should be kept close and moist, but without making the soil very wet, until the plants appear, then give air and keep them near the glass. When large enough to handle pot singly in small pots, and forward them in the frame until established, then harden them off and remove them to a light airy situation in the greenhouse, where they will succeed admirably.

GRAPE NOT COLOURING (Idem).—The cause of your Grapes not colouring well is probably the abundant crop. Overcropping is generally the cause of want of colour in Grapes, and in your case we think the sole cause.

TRENTHAM BLACK GRAPE (Reader).—There is no discrepancy in the opinions; it does keep well under favourable circumstances, in some places and seasons better than the Black Hamburgh, but in others not so well. Lady Downe's and White Tokay will succeed well in a cool vinery if heat be given at the time of their blooming and of the Grapes stoning.

PRUNING VINES (Idem).—Your young Vines newly planted ought to be pruned now to the height you require them to be in order to extend through the wall, and up the front lights to within about 15 inches of the roof. The shorter you prune them the more vigorously they will start next year, but the canes ought to reach as high as the bottom of the front lights. For planting out we prefer Vines one, and not more than two years old from the eye, good strong canes that have not fruited, the younger the better; but we see no objection to yours, they will, no doubt, do very well unless they have been fruited in pots for two or three years, and then they do not answer so well as plants of one year's growth.

MELONS AND PEACHES FOR JUNE (W. W. C.).—The seeds of the Melons should be sown early in February (first week), and grown on in a good but not too strong heat. Peaches should be started at the same time, but the house ought to have been kept at about 49° for a fortnight previously.

JASMINE GRANDIFLORUM FLOWERS FALLING (Dilemma).—We think the flowers fall prematurely from the plant not having enough water at the root, and from the house being kept too close and moist. Give more air, and keep the plant well supplied with water. The flowers at best are not of long continuance individually, though they quickly succeed each other, and the plants in that way continue a long time in bloom.

PREPARING GROUND FOR ROSES (I. Copley Cottage Gardener).—We would advise you to trench the ground at once 2 feet deep, bringing some of the lighter soil to the top, and mixing it with the surface soil, which you say is very stiff. Digging now cannot make it more adhesive, but exposure to frost will pulverise it, and you may make it more friable by adding sand. In trenching throw it in ridges, and as roughly as possible so as to expose it to frost. If you cannot obtain sand, ashes will answer the purpose of making it more open. The manure you name will not be suitable, but you may mix it with soil, and let it lie for twelve months, turning it over once or twice during the summer, and in the autumn or winter it will be a good manure for roses, and excellent for top-dressing Strawberries. Of course, the ground will be made more close and mud-like by digging it in wet weather. Chose dry weather, or dry for the season.

SELECT ROSES FOR POTS (Dilemma).—*Hybrid Perpetual*: Madame Vidot, Charles Lefebvre, Senateur Vaisse, Caroline de Sansal, Jules Margottin, Madame Boutin, Lord Macanlay, Baronne Prevost, John Hepper, and Duc de Rohan. *Tea-scented*: Devonensis and Gloire de Dijon.

PEAR BRANCH SPLIT (Inquirer).—Bind up the split part with bast making shreds, and cover the whole of the binding with clay, as in grafting. If a stake be driven firmly into the ground so that the whole tree and especially that branch can be kept from being wind-shaken, the healing will be promoted. If you enclose five postage stamps with your address, and order "Fruit Gardening for the Many," it will be sent to you free by post from this office.

GOLDEN QUEEN MELON.—We are sorry to hear from Mr. O. Taylor, that he has been inundated with applications for seeds of this Melon in consequence of his offering a few to one correspondent. *He has none left*.

REPOTTING CAMELLIAS AND AZALEAS (H. S.).—When Camellias and Azaleas are well established, they will do very well without potting for several years, merely fresh-surfacing them. We prefer that to too frequent potting. Potting every year will not hurt them if done judiciously.

WATERING A VINERY BORDER (A. R.).—We would water the inside Vine border with water at 80° before beginning to force. The quantity of water must depend on the dryness of the soil, and the time for a repetition on the character of the season.

VINES OVER-FORCED (G. H. G.).—The Vines that have been forced so hard and made weak, would be the better of being forced less, pruned more, and of stronger growth being encouraged. The roots that have come so liberally from the Vine stems, show either that the house was kept moist and the border rather dry, or that there was something the

matter with the roots, and the Vines inside consequently put forth roots in self-defence. Probably the border wants some fresh material or drainage.

VINE IN OUTSIDE BORDER (R. S.).—If you can obtain as much of your small young Vine shoot as will leave you a bud or two tolerably well ripened inside the house, we would prune to the one or two buds, and carefully remove all other buds and spray. If not, and the Vine, as you say, is so weak, we would carefully take it up, and grow it in a pot inside until midsummer.

TOP-DRESSING A VINE BORDER (R. S.).—A little lime rubbish on the surface of a border for Vines would do no harm, but the propriety of a heavy dressing would depend on the state of the border, and in no case would we add much to the surface at one time. The dressing of dung over the lime rubbish would be beneficial. Cow dung would not be so good as horse dung, unless it were half-decayed and rather dry. For want of better, fresh cow dung may be used and broken up when dry, the chief objection to using it wet and fresh is, that if the border is wet before applying the dung little air will pass through the close surface.

HYACINTHS IN POTS (An Amateur).—If your Hyacinth bulbs are in the open air under ashes, they will not probably want any water until you take them out to grow them for bloom. The moving them for this purpose ought not to take place until the pots are getting full of roots, and the top of the bulb is moving. If your bulbs are under cover they may become too dry, but it will be better to water all round the pots instead of making them too wet. We should think that being potted a month, many of the pots may now be removed into the light. Try a few and see how the roots are.

HEATING A CONSERVATORY (E. A.).—The fireplace you have in the conservatory would keep out frost, more especially if furnished with a regulator to cause a small draught at night. We do not know the terra cotta stove to which you allude, but we think a fair-sized iron stove would do for the conservatory and the gallery in connection with it, if the stove stood a few feet from the fireplace, free all round, and a metal pipe went from the stove into the chimney. In such a case the fireplace should be boarded or banked-up. The stove will give out three or four times the heat of the fireplace. A flat-topped one would be best, as you could place a vessel of water on it.

FIG AND ROSE TREES IN POTS (Agaricus).—If you wish to have a good crop of Figs from the plants in pots, do not shorten the shoots now or at all, but thin out the weakest so as to give more room. Do not let the soil in the pots become dust dry, but dryish rather than wet. Remove some of the surface soil with a pointed stick, and replace with rich compost. Do not repot either now or in the spring. When you wish to repot, do it immediately you gather the fruit. If the plants are much shaded in a vinery they will not fruit well. On the same principles as those on which we give the above advice we would say, force those fine Roses in pots as you have received them, so full of roots. Do not attempt to repot them until you have obtained flowers from them.

SUCCESSION AND HEIGHTS OF PEAS (An Amateur).—Of the three Peas named, Bishop's Longpod is about 1½ feet in height; Advancer from 2 to 2½ feet; Yorkshire Hero, 2½ to 3 feet in height. Of these none is very early. For a dwarf early Pea the best is Little Gem, 1 foot in height. It comes in a little before Advancer, and then the other kinds would follow. As a succession and higher, and fine Peas, we would recommend Harrison's Perfection, 2½ to 3½ feet; Veitch's Perfection, 2½ to 3½ feet; Mammoth Dwarf Marrow, 2½ to 3½ feet. These three are first-rate in quality and generally bear well. In some places Veitch's Perfection does not corn so well as in others. A smaller Pea always bears well—Knight's Green Marrow, from 3 to 4 feet in height.

FRUIT GARDEN ARRANGING (T. T.).—We should prefer planting in December, instead of February; but you may safely plant during mild weather until March. The meaning of "double worked," is that the plant is twice grafted; this does not interfere with the training at all. The Marie Louise Pear is one that does not succeed well on the Quince, but by working the Quince with a variety that succeeds on it, and then working that with the Marie Louise, the latter is rendered healthy and prolific. You write of cordons with single stems 2 feet apart. They will certainly only have a single stem, and but one shoot to begin with, but another shoot will be originated in the year following the planting, and you will have shoots 1 foot apart, or the wall or space will be covered with branches or cordons 1 foot apart. You certainly expressed a desire for vertical cordons. We think you are acting wisely to have all the trees against the walls oblique-trained, but those in the open ground vertical-trained. Vertical cordons will succeed admirably, 1 foot being allowed between the rows of trees.

BOILED versus UNBOILED BONES (A Lady in Cheshire).—Bones in a ground state are in general boiled, to free them of the oily matter, or rather it is extracted for making cart grease, and other purposes. In this state they are best applied to Vines for surface dressing, but for border making they are best unboiled, but kept so as to be dry or old. When used fresh, and with a quantity of fatty matter adhering to them, we have known them injure the roots of the Vines coming in contact with them. When used unboiled the bones should not be placed in immediate proximity to the Vines, but at the lower part of the border, covering for 6 inches or so of the border with turf only; or if bones are used let them be old and dry, or boiled crushed bones.

OLEANDER NOT FLOWERING (Idem).—Your plant 3 feet high does not flower because it is not old enough. We advise you to pot it next spring, when it begins to grow, in a rather small pot for the size of the plant, draining well, and using a compost of two thirds turfy loam, and one part leaf mould or sandy peat, adding one-sixth of silver sand. Encourage growth by affording a moist atmosphere, syringing twice daily, and giving a good supply of water at the roots; indeed, when growing it should have abundance of water. It should have the warmest situation in the greenhouse, and when it has ceased growing, give it the lightest and most airy situation, diminishing the supply of water, and it will, no doubt, form bloom buds and flower another year. In winter keep it dry, giving no water except to keep the foliage from flagging.

PRUNING LAPAGERIA ROSEA (W. H. M.).—It is desirable to have the shoots thinned when they become too thick. It would not injure the plant if the thinning be carefully done. Remove the oldest shoots, and especially those which have flowered. It may be done in January or February, but best when the plant is beginning to grow, or a little before it does so.

MOSS ON GOOSEBERRY AND CURRANT BUSHES (G. P.).—It would be desirable to remove the moss, and we would do so at once, and, after scraping off all you can, take off the soil round each bush as low as the roots, but without injuring them, replace it with about four good spadefuls of manure, and then cover the manure with the soil removed, or part of it, not burying the stem too deeply. You may then wait until the first rain, and whilst the bushes are wet dust them thoroughly in every part with fresh-slaked lime. It will destroy the moss, and be less tedious of application than washing them with lime and soot. The lime-dusting may be repeated early in spring before the buds open.

BETROOT STORING (Idem).—You may store Beet the same as Potatoes and cover with soil as you propose. It keeps well. To name fruit we must have good specimens. There is more than one kind of Pear called "The Pound."

PEACH TREE TRAINING AND PRUNING (O. R. O.).—Your case is not a solitary one. We see in almost every nursery trees that have from three to five or more branches or shoots, the lowest side shoots in most cases not one-third so strong as the upper side shoots and leader. In gardens we see trees everywhere with side shoots or branches not so long, nor nearly so strong, as the central part, and, unfortunately, little can be done to transfer the vigour of the upper shoots to the lower ones, for the subjects are in many cases too confirmed in their vices for any immediate improvement to be effected, and yet much may be done. In your case we would at once cut out the leader, if you have one, and reserve an equal number of side branches on each side of the stem. The tree will certainly look rather odd without a leader or shoots trained erect, or nearly so. Never mind that, the lower part of the wall must be covered first. Having cut away the leader and such of the side shoots as are not required, no further pruning will be needed unless there are shoots training in for bearing; then these must be shortened as already treated of (see page 404). The upper side shoots being stronger than the lowest side shoots, the former must be depressed, bringing them with a curve downwards, their points towards the ground or stem of the tree. Let the shoots be bent gently and with a graceful easy curve, and with care, so as not to break or otherwise damage them. Perhaps there are three shoots on each side. The strongest must be bent the most, the weakest least; or they may need vigour, then elevate them, or let their ends curve upwards, and to a degree corresponding to their weakness. The weakest should be curved upwards the most—indeed, the lower shoots can hardly be trained too erect. When they begin to grow, or push new shoots in spring, the battle will begin—namely, subduing the strong, and encouraging the weak. The strong shoots will push strongly. They have few if any fruit buds, leave all; but from the weak remove every blossom bud, and if any fruit set upon the strong shoots leave it, for a time at least, without thinning, and, having secured the useful shoots for extension and bearing shoots, take out the points of all the other shoots at the first leaf. Permit the weak shoots to push at will, and do not stop any shoots upon them until they are some length; but to encourage the shoots required for extension and bearing, take out the points of those not required at the third leaf, and keep them closely stopped, for the other shoots will now be prepared to receive and appropriate the sap. Let these grow without stopping—that is, those on the lower branches; but the shoots on the upper branches will be growing too strong and long, therefore stop them—the bearing shoots—at from 10 inches to 1 foot, and the leader of those branches to 14 inches, keeping them closely stopped to one leaf afterwards, and the sap will be diverted from the strong to the weak shoots, which, being trained erect and not stopped, will acquire a vigour equal, if not superior, to the upper branches and shoots. It will be understood from the preceding remarks that the lower branches are to have vigour imparted to them by raising them, encouraging growth, depressing the strong branches, stopping the shoots of the latter, and allowing these to carry more fruit than if they were not much more vigorous than the other part. All this being carefully attended to, the lower shoots may be made even stronger than the upper ones. The maintenance of an equality of vigour does not only apply to height, but to the side branches, for those on one side may be weak, those on the other strong; therefore there must be a greater depression of the strong shoots and a greater elevation of the weak, for it is necessary the branches on each side of the tree should correspond in vigour. If one side be weaker than the other, the branches of the weaker side must be elevated more than those on the stronger side, whilst the others may need to be depressed. The shoots on the latter ought to be kept more closely pinched, whilst those on the weak shoots should be encouraged. The amount of foliage on the strong branches will be less than on the others, and the weak ones should be trained at full length, and the shoot at the extremity left unshortened, for the lowest side shoots cannot be had too long. By proceeding as above you will overcome in time the vigour of the upper branches, and secure for the lower what is necessary for their extension; and having covered the lower part of the wall, covering the upper part is very easily accomplished. You cannot obtain the form of trees shown in figs. 4 and 8, but you may originate principal branches from the two uppermost, as described for them, and you will only have two side shoots below them. If your trees are not too old, or there are shoots on the lowest two branches at their base, you may remove all but the lowest two branches, and obtain from the shoots at their base the branches required, and you will have the form of fig. 4 or 8, pages 267 and 303. It will be an advantage that the side shoots are some length to begin with, and you will not lose much if anything by heading the trees to the lowest two branches, but they must have shoots of this year near to the stem, or buds from which to originate the principal branches.

STRIPPING BARK OFF VINES (Bubble and Squeak).—No one but the most ignorant could have advised the bark to be stripped off the Vines, to have them then painted with a linseed oil compound, and then turned out of the vinery; and all this had entirely merely to destroy thrips. The fumigation with tobacco and the clay paint you have adopted are correct. The brown spots on the Vine shoots are a fungus, and will probably be destroyed by the clay and sulphur painting.

FRUIT TREES FOR NEAR MANCHESTER (E. L.).—Apples: Devonshire Quarrenden, Downton Pippin, Ribston Pippin, Cockle Pippin, Margil, Fittmaston Nonpareil, and Sturmer Pippin. Pears: Jargonelle, Beurré d'Amant, and Marie Louise. Plums: Jefferson and Green Gage. Cherry: Early Purple Gean. For South Wall: Bellegarde Peach and Violette Hative Nectarine.

ERRATA—JERSEY FOR WINTER.—Page 384, first column, line twenty-five, for "south-west" read "north-west." Same page, same column, line

sixty-four, for "British Bree's Boarding-house," read "British Hotel, Bree's Boarding-house, &c."

NAMES OF FRUITS (*M. D. M.*).—4, Lemon Pippin; 22, 55, and 62, King of the Pippins; 36 and 47, Golden Russet; 51, Pearu's Pippin; 57, Adams'

Pearmain; 59, Golden Noble; 60, Lamb Abbey Pearmain; 61, Dutch Mignonne; 69, Caraway Russet; 77, Court of Wick.

NAME OF PLANT (*L. M.*).—Your Orchid appears to be *Epidendrum phoeniceum*.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending December 1st.

POULTRY, BEE, AND HOUSEHOLD CHRONICLE.

THE BIRMINGHAM POULTRY SHOW.

This is indeed become an accomplished fact. Things are altered since the time when there was any one interested in poultry who was not familiar with Bingley Hall—who could not, when the name was mentioned, immediately figure to himself the long rows of pens, the crowds of eager eyes looking at the numbers, and trying to see them and the prize list at the same time, the varied faces showing every feeling from great joy to the most intense disappointment, and the growing crowd augmented by the arrival of each train during the day, till at last progress becomes almost impossible, and motion is often confined to surging and swaying, which are easily seen from either end of the row. It is well that, with few exceptions, all have a common object in view, and are there on holiday footing, in company with those who have congenial tastes. Anything like a difference of opinion in two sections of a crowd confined to one of these narrow passages would be terrible. Retreat or advance would be impossible, and a sawpit for a duel would give elbow-room compared with it. The excellent management of this Show, and the favour it meets with at the hands of the public, have caused the entries to increase yearly, until there is not sufficient accommodation for competitors. Already means have been taken to lessen the numbers of entries, and the space allotted to them has been enlarged, but the cry is still "they come," and at this meeting three parties would be justified in asking for a change; they would be the birds, the public, and the exhibitors. Some want more light, others more space. There was not room for the public between the rows of pens. The Council and managers of this great Show are not only anxious to please the public, but during their trile apprenticeship of twenty-one years they have gained so much experience in doing so, that we have no doubt they will adopt such measures as will meet all objections.

We must leave some details for next week. The time at which we go to press compels us to close our report after the first day of the Show. It was thronged to excess throughout. In our next number we shall be able to give the statistics of the meeting, the sales, and many other particulars. We must for the present confine ourselves to the remarks called for by the different classes.

There were 395 pens of *Dorkings*. Mr. Statler, the Duchess of Newcastle, Mrs. Arkwright, the Hon. H. Fitzwilliam, Admiral Hornby, Messrs. Lingwood, Patten, and Newton all deserved the laurels they gained. It would have been gratifying to the Judges had they been able to give prizes to all the highly commended birds. They deserved them. These names refer to the cocks only, but the same, with few exceptions, figure among the prizetakers for hens and pullets. The Duchess of Newcastle showed beautiful hens, and very heavy. The Hon. H. Fitzwilliam took three prizes. Admiral Hornby carried off the piece of plate for the best pullets, with two perfect birds weighing 17 lbs.

Eight prizes were awarded without difficulty to Silver-Greys. No lack of birds of faultless size, symmetry, and feather. Mr. Smalley's bird was unusually good. Ladies Dartmouth and Bagot deserve the same mention. Messrs. Barn, Longland, and Holt were deservedly successful, and there was less difference in weight between the Silver-Greys and others than we have ever before noted. Mr. John Robinson is always at home among the White Dorkings, but Mrs. Hartwell and Mr. Cheyee distanced him in cocks.

312 pens of *Cochins*. They were good classes. They have nearly arrived at their limit, apparently, and exhibitors must be content to "rest and be thankful." The first prize for cocks went to Messrs. Taylor and Dawes; for hens and pullets, to the former gentleman. Mr. Howard Mapplebeck was the largest prizetaker in these classes. His name figures seven times in the prize list. Messrs. Julius Sichel, Beasley, Taylor, Fell, and Hale showed excellent specimens. Brown and Partridge afforded another triumph to Mr. Tudman, who carried off a piece of plate given for the best bird. The cocks in these classes were more than meritorious. Many of the pullets were also good, but others were too yellow.

Stimulated by a piece of plate as an extra prize, the White showed in their best form. We have seldom seen so many birds that required close judging. The principal honours belong to Mr. Smalley, divided with Mrs. Williamson and Messrs. Swindell, Taylor, and Lamb.

232 pens of *Brahmas*. We cannot help thinking of the time when it was doubtful whether these birds would ever make a class. There were doubts whether they were a pure breed, but they have outlived their tradacers, and now form one of the largest classes. Beautiful specimens were plentiful. Mrs. Hurt and the Hon. Miss D. Pennant were among the most successful. The Duke of Newcastle exhibited a beautiful bird, that deservedly took a first prize. Messrs. Sabin, Leech, Jopp, Wright, Colonel Bagot Lane, and Mr. Boyle distinguished themselves worthily. Some of the hens and pullets showed a brown shade on the feathers that is objectionable. The Light birds have now made a second and large class. A piece of plate was offered for the first prize, and gained by Mr. Maynard, of the Isle of Wight. Mr. Crook, who gave the plate, took first prize for hens, also the second. Mr. Dowsett showed well, taking two prizes. We thought highly of Mr. Crowley's birds. It is impossible to name all that deserve mention, but we speak well of the class, merely warning exhibitors against vulture hocks.

Mallards fall off; only seven pens that call for no particular mention.

The introduction of new breeds that a short time since only showed in the "varieties" brings us to the *Crevé-Cœurs*. They were really good, large, and handsome birds. Seventeen pens figured in the prize list. Mr. Zurborst took first and a piece of plate. Mr. Blükhorn was very successful. The hens and pullets were hardly so good as the cocks. *Houlians* again have held their own. Sixteen pens were distinguished by the Judges, and here the hens and pullets were better than the cocks; but we must except Mr. Wood's, of which we thought highly. Mr. Heald had the greatest success, and deservedly. *La Flèche* showed poorly in numbers and merit, and we do not believe they will hold their own.

The beautiful *Spanish* were the same as ever, and many of the birds were of the pure type; smooth, good, white faces, without the cauliflower ridges that amount to a defect. The Hon. Miss Pennant and Mr. Redbard took the prizes for cocks with beautiful birds. Misses Hyde and Beldon, and Mr. Teebay merit the mention they obtained.

Another new class—of *Black Hamburgs*. Four pen mentions. Most of the prizes went to Mr. Kilvert. These birds are very beautiful. We can speak most highly of all the Hamburgs. The pencilling of the Golden variety was perfect, every feather, to the tip of the tail, was accurately marked. The list must speak for us, or we shall exceed our limits. Mr. Pickles deserved his prize and piece of plate, and many of the commended were worthy of higher honours. Messrs. Hyde and Beldon each took first and cups. Messrs. Pickles, Brierley, Leeming, and Pitts were all deservedly distinguished. Miss Wakeman showed two beautiful birds in the hen and pullet class.

Polish fowls in every class were above the average. The Black with white crests were perfect, and Mr. Shaw's birds deserve every praise. The Golden were more numerous and almost as good. Mr. Harvey did here as Mr. Shaw did before him. Mr. Williams showed well. Silver were more numerous than they have been for many years, and were a long triumph for Mr. Adkins.

There are not prizes enough for the "Variety Class." Lady

Aylesford, Mrs. Wilkin, and Mr. Fowler took the prizes, and many were commended.

A new show begins when we have to speak of the *Game*. It is impossible to do justice to the many classes within the limits of a report. The Duke of Newcastle most fully deserved the prize and silver cup he took in Class 58. Messrs. Gardner and Wood deserved to rank in the same category. Mr. Wood was the most successful exhibitor. We were struck with the beauty of the Duckwings; we do not think we have ever seen them so good and so true. The Black Reds were better, in our opinion, than the Brown Reds, but all classes were beautiful.

Bantams were very good, but among the Golden-faced there was a tendency to sickle feathers. The Black were more numerous and better than the Whites. The first prize in Varieties was given to rumpless birds. The Game Bantams are like the Game fowls, so numerous were the entries, and the quality so good. Messrs. Eaton and Parsons showed beautiful birds. 42 pens were in the prize list.

The *Rouen Ducks* again beat the Aylesburys in weight and numbers. We cannot speak too highly of them. The Black East Indians were perfect. The first prize birds were faultless in size and colour. What shall we say for *Geese*? They were giants. Mr. Fowler showed a pair of birds, a gander weighing 37½ lbs., and a goose 21 lbs.

We may return to these subjects, but in the necessity that exists for a hurried report, we cannot give the extended account we should wish.

The *Turkeys* were very good. We would particularly remark one or two of the American cocks, that were really birds of beautiful plumage.

The arrangements were, as usual, perfect, and the gentlemen who have been the originators and managers of this great Show were at their posts, effective, urbane, and anxious as usual for the comfort of all who were visitors to their great undertaking.

DORKING (Coloured, except Silver-Grey).—*Cocks*.—First and Cup, T. Statter, Whitefield, Manchester. Second, Duke of Newcastle, Clumber. Third, Admiral Hornby, Knowles Cottage, Prescot. Highly Commended, Lieut.-Col. H. B. Lane, Bracknell; J. White, Waraby; W. J. Drewry, Drakelow, Burton-on-Trent; J. Longland, Grendon, Northamptonshire; A. Potts, Chester; Admiral Hornby.

PIGEONS.

TUMBLERS (Almond).—First, Second, and Third, R. Fulton, Deptford. Highly Commended, J. Fielding, jun., Rochdale. Commended, J. Ford; R. Fulton.

CARRIERS (Black).—*Cocks.*—First and Cnp, Second, and Third, R. Fulton. Commended, E. Horner, Harewood, Leeds; F. Crossley, Elland, near Halifax. *Hens.*—First, R. Fulton. Second and Commended, T. Crossley.

CARRIERS (Dun).—*Cocks.*—First, E. Horner. Second, J. C. Ord, Pimlico. Third and Commended, R. Fulton. Highly Commended, G. Charnley, Preston. *Hens.*—First and Commended, R. Fulton. Second, F. Crossley. Highly Commended, W. Harvey, Sheffield.

CARRIERS (Any other colour).—First, R. Fulton. Second, J. C. Ord.

POUTERS (Red).—*Cocks.*—First and Highly Commended, W. R. Rose, Cransley Hall, near Kettering. Second, C. Bulpin, Riverside, Bridge-water. Commended, A. H. Stewart, Birmingham. *Hens.*—First, W. R. Rose. Second, R. Fulton. Highly Commended, R. Fulton; A. H. Stewart.

POUTERS (Blue).—*Cocks.*—First and Medal, A. H. Stewart. Second, F. Crossley. Highly Commended, E. Horner; R. Fulton. *Hens.*—First, and Highly Commended, F. Crossley. Second, S. Shaw, Stainland, Halifax. Commended, A. H. Stewart.

POUTERS (Black).—*Cocks.*—First, R. Fulton. Second, A. Heath, Calne. *Hens.*—First and Second, R. Fulton.

POUTERS (White).—*Cocks.*—First and Second, R. Fulton. Highly Commended, W. Harvey. *Hens.*—First, W. B. Tegetmeier, Finchley. Second, R. Fulton. Highly Commended, R. Fulton; A. Heath. Commended, W. R. Rose.

POUTERS (Any other colour).—*Cocks.*—First, Withheld. Second, R. Fulton. *Hens.*—First, A. H. Stewart. Second, R. Fulton. Highly Commended, W. R. Rose.

BALDS OR BEARDS.—First, J. Fielding, jun. Second, R. Fulton. Third, O. H. C. Oates, Besthorpe, Newark, Notts. Highly Commended, J. W. Edge, Birmingham.

TUMBLERS.—First, F. Crossley. Second, R. Fulton. Third, J. Ford. Highly Commended, J. Fielding, jun.; R. Fulton.

RUNTS.—First, Second, and Highly Commended, T. D. Green. Third, H. Yardley.

JACOBINA (Yellow).—First, J. W. Edge. Second, E. Horner. Highly Commended, E. E. M. Roys, Greenhill, Rochdale. Commended, H. M. Maynard, Holmewood, Ryde, Isle of Wight.

JACOBS (Any other colour).—First, H. M. Maynard. Second, E. E. M. Roys. Highly Commended, S. Shaw. Commended, R. Fulton.

FANTAILS (White).—First and Silver Cup, J. W. Edge. Second, H. Yardley. Third, W. R. Park, Abbots Meadow, Melrose. Highly Commended, F. Horner; W. Choyce, Sibson, near Atherstone; T. C. & E. Newbitt, Epworth; C. Bulpin, Riverside, Bridgewater; H. Yardley.

FANTAILS (Any other colour).—First, J. W. Edge. Second, H. Yardley. Highly Commended, W. Choyce.

TRUMPETERS (Mottled).—First, E. Horner. Second, J. Firth, jun., Webster Hill, Dotsbury. Commended, E. Horner.

TRUMPETERS (Any other colour).—First, W. H. C. Oates. Second, J. Firth, jun. Third, C. Bulpin. Highly Commended, E. Horner.

OWLS (Foreign).—First and Second, J. Fielding, jun.

OWLS (English).—First, C. Bulpin. Second, J. Watts, Hazelwell Hall, King's Heath, Birmingham. Highly Commended, C. Bulpin.

NCNS.—First, C. Bulpin. Second and Third, W. Banks, Weston House, Runcorn. Highly Commended, E. Horner; S. Shaw. Commended, C. Bulpin.

TURBITS (Red and Yellow).—First, E. Horner. Second, S. Shaw. Highly Commended, S. Shaw; J. Thompson, Bingley. Commended, J. Watts.

TURBITS (Any other colour).—First, C. Bulpin. Second, E. Horner. Highly Commended, S. Shaw.

BARBS (Black).—First, F. Crossley. Second, G. Charnley, Preston. Third, Withheld.

BARBS (Any other colour).—First, G. Charnley. Second, E. Horner. Highly Commended, G. Charnley.

DRACOONS (Blue).—First, F. Crossley. Second, S. Shaw. Highly Commended, J. Percivall; J. W. Ludlow, Birmingham; E. Horner.

DRACOONS (Red or Yellow).—First, C. Bulpin. Second, J. W. Ludlow. Highly Commended, C. Bulpin.

DRACOONS (Any other colour).—First, J. Percivall. Second, E. Horner. **MAGPIES.**—First, E. Horner. Second, J. Percivall. Third, E. Horner.

ANTWEPS.—First and Second, H. Yardley. Third, H. Allsop, Birmingham.

ARCHANGELS.—First, J. W. Edge. Second, C. Bulpin. Highly Commended, A. Heath.

SWALLOWS.—First, Second, and Third, F. H. Paget.

ANY OTHER NEW OR DISTINCT VARIETY.—First, H. Noyé, Birmingham. Equal First, H. Draycott. Second, F. H. Paget. Equal Second, H. Draycott. Third, W. Banks. Equal Third, E. Horner; H. Yardley. Highly Commended, C. Bulpin; F. H. Paget.

JUDGES.—Poultry: G. J. Andrews, Esq., Dorchester; Mr. John Bailly, Mount Street, Grosvenor Square, London; Mr. James Dixon, North Park, Clayton, Bradford; Mr. E. Hewitt, Spark Brook, Birmingham; Mr. R. Teebay, Fulwood, near Preston; J. H. Smith, Esq., Skelton Grange, York; Mr. R. Woods, Osberton, Worksop; Mr. Edward Lowe, Comerford, Tamworth. **Pigeons:** Mr. Harrison Weir, 9, Lyndhurst Road, Peckham, London, S.; Mr. T. J. Cottle,

Pulteney Villa, Cheltenham (Classes 96 to 111); Mr. F. Esquilant, 4, Effra Road, Brixton, London, S.; Mr. T. Ridpath, Poplar House, Rushmore, Manchester (Classes 112 to 135).

OAKHAM POULTRY SHOW.

THE Poultry Show in connection with the Rutland Agricultural Society's Exhibition was held at Oakham on the 25th and 26th of November in a spacious marquee. The collection of poultry and Pigeons consisted of 578 pens, not only good in number, but also in quality, which is surprising when we consider how close the date of the Show is to that of the Great Show at Birmingham.

There were no less than twenty-four coloured *Dorking* cocks, and in addition to those which took prizes, the Judges selected seven pens for commendation. Silver-Grays were numerous, but many good birds were passed over in consequence of being entered in the Coloured class. There were upwards of fifty pens of *Game*, but the best birds were disqualified, being entered in the Brahma and Hamburg classes. This was surprising, seeing that they belonged to great exhibitors of several years standing. *Turkeys* were particularly good. There were fifteen entries of single cocks. The *Game Bantams* were the largest class, there being sixty-one pens. Here some evil-disposed person abstracted both sickle feathers from the tail of the first-prize bird, which is the more to be regretted because the Stewards and Mr. Wellington, the Honorary Secretary, were unremitting in their attention to the specimens committed to their charge.

Pigeons were numerously represented; the class for new or distinct varieties contained upwards of thirty pens.

DORKINGS (Coloured).—*Cock.*—First, H. Warner, Loughborough. Second, G. H. Finch, M.P., Burley-on-the-Hill. Third, J. Hornsby, Grantham. Commended, H. L. Bradshaw, Wakerley; Rev. C. H. Crosse, Cambridge; W. Fowler, Manton, Uppingham; D. C. Campbell, M.D., Brentwood; R. Wood, Clapton, near Thrapstone; G. Clarke, Long Sutton; T. Tatham, King's Thorpe. *Hens or Pullets.*—First, D. C. Campbell. Second, H. Lingwood, Barking, Needham Market. Third, R. Wood. Highly Commended, H. Bradshaw, Lee; Lady L. Charteris, Atleborough. Comm. J. Hornsby.

DORKINGS (Silver-Gray).—*Hens or Pullets.*—First, H. L. Bradshaw, Wakerley. Second, W. Fowler, Manton, Uppingham. Commended, J. Longland, Grendon, Northampton; Marchioness of Exeter, Burghley.

DORKINGS (White).—*Cock.*—First, D. C. Campbell, M.D. Second, H. Lingwood. Highly Commended, Mrs. Syson, Eppingham. *Hens or Pullets.*—First, H. Lingwood. Second, Highly Commended, and Commended, Mrs. Syson.

SPANISH.—Cock.—First, E. Brown, Sheffield. Second, J. Clews, Walsall. Highly Commended, Hon. Miss Douglas Pennant, Penrhyn Castle, Bangor. Commended, H. Snushall, Gedgey. *Hens or Pullets.*—First, E. Brown. Second, Hon. Miss Douglas Pennant. Third, F. James Peckham, Rye, Surrey. Highly Commended, H. Lingwood, Martlesham, Woodbridge, Suffolk.

COCHINS (Cinnamon, Buff, or Partridge).—*Cock.*—First, H. V. Story, Lockington Hall, Derby. Second, J. Longland, Grendon. Third, Mrs. Woodcock, Leicester. Highly Commended, H. Lingwood, Martlesham, Woodbridge; H. Warner, Loughborough. *Hens or Pullets.*—First, H. Lingwood, Barking. Second, T. M. Derry, Gedgey. Third, Mrs. A. Woodcock. Highly Commended, W. A. Barnell, Southwell; J. M. Wellington, Oakham; Rev. G. Gilbert. Commended, Mrs. A. Woodcock; H. V. Story.

COCHINS (White or Black).—*Cock.*—First and Third, Mrs. A. Williamson, Queniborough Hall, Leicester. Second, H. J. Godfrey, Hammer-smith, London. *Hens or Pullets.*—First and Second, Mrs. A. Williamson. Third, H. J. Godfrey.

BRAHMA POOTRA (Any colour).—*Cock.*—First, Mrs. Burrell, Ipswich. Second, Hon. Miss Douglas Pennant. *Hens or Pullets.*—First, H. Lingwood, Martlesham. Second, B. Jarvis, Mansfield.

HAMBURGS (Silver-spangled).—*Cock.*—First, Withheld. Second, J. Walker, Knaresborough. *Hens or Pullets.*—First, A. Houghton, Asfordby. Second, Miss Almey, Oakham. Commended, Mr. Almey.

HAMBURGS (Silver-pencilled).—*Cock.*—First, J. Walker. Second and Commended, A. Houghton. *Hens or Pullets.*—First, J. Walker. Second, Mrs. Burrell. Commended, A. Houghton.

HAMBURGS (Gold-spangled).—*Cock.*—First, A. Houghton. Second, J. Pearson, Allerton, Bradford. Highly Commended, T. Blakeman, Totten-hall; T. Walker, jun., Denton. *Hens or Pullets.*—First, T. Blakeman. Second, Mrs. Burrell. Commended, S. & R. Ashton, Mottrai.

HAMBURGS (Gold-pencilled).—*Cock.*—First and Highly Commended, W. K. Tickner, Ipswich. Second, J. Pearson. *Hens or Pullets.*—First, W. K. Tickner. Second, J. Walker.

GAME (Red and other Dark colours).—*Cock.*—First, R. Hall, Cambridge. Second, Mrs. Fludyer, Aryston Hall, Uppingham. Third, B. Jarvis. Commended, E. Aykroyd, Bradford; Tilton & Redman, Holnfield, Oxenden. *Hens or Pullets.*—First, T. Garton, Oakham. Second, H. Jennings, Allerton, Bradford. Third, H. Warner. Highly Commended, Capt. Wetherall, Loddington. Commended, J. Driver, Allerton.

GAME (White, Piles, and Light colours).—*Cock.*—First, B. Jarvis. Second, R. Swift, Southwell, Notts. Third, E. Winwood, Worcester. Highly Commended, W. Chadwick, Oxenden Cross, Halifax. *Hens and Pullets.*—First, S. Dragon, Oundle. Second, Rev. G. Blake, Britton. Third, H. Jennings, Allerton, Bradford. Highly Commended, E. Everard, Leicester. Commended, Mrs. Fludyer.

BANTAMS (White Clean-legs).—First, W. H. Tomlinson. Second, S. and R. Ashton. Highly Commended, H. L. Bradshaw. Commended, O. Cresswell, Hanworth Rectory.

BANTAMS (Black Clean-legs).—First, S. & R. Ashton. Second, S. S. Mossop, Long Sutton. Highly Commended, A. Storrar, Peterborough; T. C. Harrison, Hull.

BANTAMS (Gold-laced).—Prize, T. C. Harrison.

BANTAMS (Silver-laced).—Prize and Commended, G. H. Finch, M.P.

GAME BANTAMS (Any colour).—*Cock.*—First, W. Adams, Ipswich. Second, Mrs. Fludyer.

cond, Rev. G. Raynor, Tonbridge. Third, H. Warner. Highly Com-
mended, J. M. Otter, Newark-on-Trent; Rev. C. H. Crosse; J. Parlett. Com-
mended, J. Parlett, Huntingdon; E. Sheerman, Chelmsford. *Hens or*
Pullets.—First, Rev. G. Raynor. Second, Capt. Wetherall. Third, J. M.
Wellington, Oakham. Highly Commended, J. Parlett. Commended, J.
Parlett; P. Bonrose, Derby; M. Kew, Market Overton; H. Warner.
BANTAMS (Any other distinct variety).—Prize, Mrs. A. Woodcock.
Commended, S. A. Wyllie, East Malsey.

POLANDS (Any colour).—Prize, C. Boothby, Louth. Commended, Lady
L. Charteris.

ANY OTHER DISTINCT VARIETY.—First, Hon. C. W. Fitzwilliam,
Wentworth Woodhouse (La Fleche). Second, Lady L. Charteris (Black
Crève-Cœur). Highly Commended, W. Dring, Faversham (Crève-
Cœur). Commended, Lady H. Hazlerigg, Tugby, Leicester.

CROSSBRED CHICKENS.—First, Mrs. Syson. Second, Third, and Fourth,
M. Kew. Commended, J. Wellington; Rev. E. Alder, Etwell Vicarage,
Derby; C. Chapman, Exton, Oakham.

TURKEYS (Any colour).—Cock.—First, Mrs. E. Harris, Sutton St. James.
Second, Lady L. Charteris. Third, W. Hughes, Oakham. Highly Com-
mended, W. Kirk, Wymondham; R. R. Seaton, Empingham; W. Hughes,
Oakham. Commended, R. B. Seaton; G. Turner, Uppingham; G. R.
Pearson, Colsterworth; Mrs. Berridge, Burley-on-the-Hill; Mrs. E.
Harris. *Hens*.—First, Mrs. E. Harris. Second, G. R. Pearson. Third,
Mrs. Berridge. Highly Commended, M. Kew, Market Overton, Oakham;
Mrs. E. Harris. Commended, W. Kirk; R. B. Seaton; G. R. Pearson;
M. Kew.

DUCKS (White Aylesbury).—First, Mrs. Barrell. Second and Third,
J. Hornsby. Highly Commended, W. Carver & Sons, Ingarsby, Leicester;
J. Hornsby.

DUCKS (Rouen).—First, J. White, Netherton, Wakefield. Second, R.
Wood. Third, G. R. Pearson.

DUCKS (Any other variety).—First, M. Kew. Second, T. C. Harrison.
Highly Commended, G. H. Finch, M.P. Commended, T. C. Harrison,
Hall; Lady H. Hazlerigg.

DUCKS (Crossbred or Common).—First, J. M. Wellington. Second,
and Highly Commended, Mrs. Berridge. Commended, Mrs. Blackwood,
Oakham; Lady H. Hazlerigg.

GESE (Any colour).—First, J. Garton, Loughborough. Second, J.
Christian, Barrow, Oakham. Highly Commended, M. Kew. *Gooslings*.—
First, J. Christian. Second, J. Garton, Highly Commended, J. Christian.

PIGEONS.

TUMBLERS.—First, P. H. Jones, Fulham. Second, J. Fielding, jun.,
Rochdale. Highly Commended, H. Draycott, Humberstone, Leicester.
CARRIERS.—First, Pen 470, name omitted in catalogue. Second, E.
Walker, Leicester. Commended, H. Headley, Leicester; A. Storar,
Peterborough.

POUTERS.—First, P. H. Jones. Second, H. Draycott.
JACOBINS.—First, H. Headley, Leicester. Second, P. H. Jones, Fulham.
Highly Commended, J. Thompson, Bingley.

FANTAILS.—First, W. H. Tomlinson, Newark-on-Trent. Second, H.
Draycott. Commended, G. G. Hall; W. H. Tomlinson; F. J. Leach,
Middlesbrough; H. Headley; J. F. Loversidge, Newark; P. H. Jones.

TRUMPETERS.—First, P. H. Jones. Second, J. Thompson. Highly
Commended, H. Yardley; E. Sheerman, Chelmsford.

NUNS.—First, W. Croft, Killinghall. Second, P. H. Jones. Highly
Commended, J. Thompson. Commended, F. J. Leach, Middlesbrough.

TURBITS.—First, J. Fielding, jun., Rochdale. Second, F. J. Leach.
Highly Commended, F. H. Paget; J. Thompson; P. H. Jones.

RENTS.—First, H. Yardley. Second, H. Headley.
ANY OTHER NEW OR DISTINCT VARIETY.—First, H. Draycott (Fribbacks).
Second, H. Headley (Brunswicks). Highly Commended, Mrs. Berridge
(Fantails and Jacobins); Miss F. Easton, Hull (Owls); A. Storar (Owls);
P. H. Jones (Magpies, Fairies, and Dragons). Commended, H. Yardley;
T. Fielding (White Owls); F. J. Leach (Magpies); H. Headley (Owls);
J. C. Marshall, Peterborough (Magpies).

The Judges were Mr. W. B. Jeffries, The Arboretum, Ipswich, and
Mr. W. R. Tegetmeier, London.

THE CHIPPENHAM POULTRY EXHIBITION.

THIS was certainly one of the very best Poultry Shows that has ever
been held in this locality; and, when we consider that the great Show
at Birmingham was so near at hand, the excellence of the poultry
exhibited at Chippenham is only the more remarkable. The arrange-
ments were very good, and the attention paid to the poultry was most
efficient. *Dorkings* were excellent, and the *Game* fowls not less so.
Some very superior *Cochins* were exhibited, and of *Hamburghs* the
number of entries was large and the classes good. *Polands*, though
few in number, were of very superior quality, but the *Bantams* were
neither so numerous nor so good as in past years. The weather was
favourable.

DORKINGS.—First, — Forster, Freshford. Second, Miss Millward, New-
ton St. Loë. Highly Commended, — Hanks, Malmesbury. Commended,
— Hanks; — Bennett, Yale.

SPANISH.—First, Tonkin & Tuckey, Bristol. Second, — Forster.
GAME (Black-breasted and other Reds).—First, — Waller, Beversbrook
Second, F. Bailey, Calne. Highly Commended, — Bennett; W. H. Stagg
Netheravon.

GAME (Any other variety).—First, S. Sainsbury, Devizes. Second, J.
May, Bristol. Highly Commended, S. Sainsbury.

COCHINS.—First, Miss Millward. Second, — Maggs, Tetbury. Com-
mended, Miss Millward.

BRABLES.—First, J. Hinton, Hinton. Second, — Hanks, Somerset.
HAMBURGHS (Gold or Silver-pencilled).—First, H. Thompson, Hill-
marton. Second, — Bennett. Commended, Rev. H. Mullens, Acton
Turville; — Hanks.

HAMBURGHS (Gold or Silver-spangled).—First, Rev. W. S. Shaw, Bath.
Second, W. Hullart, Chippenham. Commended, — Frond, Wootton
Bassett.

POLANDS.—First, J. Hinton. Second, — Powney, Calne. Highly Com-
mended, J. Hinton; F. Perrin, Bristol.

GAME BANTAMS.—First, — Cambridge, Bristol. Second, J. May, Bristol
Commended, J. May.

BANTAMS (Any other variety).—First, — Cambridge. Second, Tonkin
and Tuckey.

ANY OTHER DISTINCT BREED.—First, Mrs. Ward, Marlborough. Se-
cond, J. Hinton.

CROSS-BREDS.—First, S. Sainsbury. Second, J. Hinton.

TURKEYS.—First, Miss Millward. Second, H. Brinkworth, Corsham.

Highly Commended, I. Smith, Avon.

GESE.—First, — Baker, Allington. Second, W. Archer, Wootton
Bassett.

DUCKS (Rouen).—First, G. M. Hulbert, Perrott's Brook, Cirencester.
Second, — Hanks, Malmesbury. Highly Commended, Rev. H. Mullens.

DUCKS (Aylesbury).—First, — Hanks. Second, Forster. Highly Com-
mended, — Bennett.

DUCKS (Any other variety).—First, Miss Millward. Second, Rev. H.
Mullens. Highly Commended, Rev. H. Mullens; H. Brinkworth, Corsham.

SWEEPSTAKES FOR SINGLE GAME COCK.—First, W. H. Stagg, Netheravon.
Second, — Orledge, Chippenham. Third, — Waller, Beversbrook.

E. Hewitt, Esq., of Birmingham, officiated as Judge.

THE JOHNSTONE POULTRY AND PIGEON SHOW.

THIS was held on the 21st of November, when the following prizes
were awarded:—

SPANISH.—First and Second, J. Crawford, Beith. Third, D. M'Kean,
Strathblane. Highly Commended, J. Thomson, Paisley.

DORKINGS.—First, A. Drummond, Glasgow. Second, A. Grant, Kil-
barchan. Third, T. Raines, Stirling. Highly Commended, T. Smith,
Stewarton.

BRAHMA POOTRAS OR COCHIN-CHINAS.—First, A. Crawford, Airdrie.
Second, J. Taylor, Johnstone. Third, J. Boyd, Paisley. Highly Com-
mended, W. Robertson, Paisley.

GAME (Black-breasted).—First, Third, and Highly Commended, P.
Alexander, Bridge of Weir. Second, R. Stirrat, Dalry.

GAME (Any colour).—First, J. MacIndoe, Gateside. Second, J. Menzies,
Pollockshaws. Third, P. Alexander. Highly Commended, A. Drum-
mond.

SCOTCH GREYS.—First, J. Hamilton, Hamilton. Second, J. Taylor,
Johnstone. Third, R. Blair. Highly Commended, J. Fulton, Beith.

HAMABURGHS (Golden-spangled).—First, R. Cunningham, Stewarton.
Second, J. Jardine, Kilmarnock. Third, H. Hope, Glasgow. Highly
Commended, D. Black, Paisley.

HAMABURGHS (Golden-pencilled).—First, J. Armstrong, Longton. Se-
cond, W. Bachop, Paisley. Third, A. Grant. Highly Commended, J.
Smith, Stewarton.

HAMABURGHS (Silver-spangled).—First, J. Logan, Carnwath. Second,
A. Grant, Kilbarchan. Third, J. Stort, Barrhead. Highly Commended,
A. Glen, Erskine.

HAMABURGHS (Silver-pencilled).—First, W. A. Bachop, Paisley. Second,
A. Thomson, Paisley. Third, J. Dryborough, Paisley. Highly Com-
mended, D. White, Johnstone.

GAME BANTAMS.—First, J. Gow, Kilbarchan. Second, T. Raines, Stir-
ling. Third, J. Sharp, Johnstone. Highly Commended, A. Grant.

BANTAMS (Any other variety).—First, J. Logan, Carnwath. Second, W.
Morris, Paisley. Third, A. Grant. Highly Commended, A. Robertson.

ANY OTHER BREED.—First, J. Pollock, Busby. Second, J. Allan, Kil-
birnie. Third, J. Connel, Johnstone. Highly Commended, J. Anderson,
Johnstone.

DUCKS (Aylesbury).—First, A. Robertson. Second, J. Logan. Third,
J. Dryborough. Highly Commended, A. Robertson.

DUCKS (Rouen).—First, J. Hamilton, Haughton. Second, Z. H. Heys,
Barrhead. Third, J. H. McNab, Barrhead. Highly Commended, A.
Robertson.

SELLING CLASS.—First, A. Grant. Second, A. Drummond. Third,
Z. H. Heys. Highly Commended, R. Blair, Johnstone.

EXTRA PRIZES.—For the best pens from Classes 1 to 8.—Prize, P.
Alexander. For the best pen from Classes 9 to 16.—Prize, J. Gow, Kilbar-
chan.

PIGEONS.

POUTERS.—First, J. Butler, Glasgow. Second and Third, H. Thomson.
Highly Commended, J. Campbell, Johnstone.

POUTERS (Black or Red).—First and Third, J. Sharp, Johnstone. Se-
cond, J. Entler. Highly Commended, J. Campbell.

POUTERS (Any other variety).—First, J. Sharp (Whites). Second, J.
Butler (Yellow). Third, T. McDonald, Johnstone. Highly Commended,
H. Thomson.

CARRIERS.—First and Second, H. Martin, Glasgow. Third, J. Camp-
bell. Highly Commended, J. Gow.

TUMBLERS (Short-faced).—First and Second, J. Sharp.

BARS.—First and Second, J. Sharp.

FANTAILS.—First, J. Sharp. Second, J. Smellie, Wishaw. Third, R.
Blair. Highly Commended, W. Reid, Lochwinnoch.

JACOBINS.—First, J. Campbell. Second, Third, and Highly Commended,
J. Sharp.

TUMBLERS (Common).—First, R. Blair. Second, H. Martin. Third,
D. R. MacKay, Glasgow. Highly Commended, J. Sharp.

COMMON.—First, C. Anderson, Johnstone. Second, J. Campbell, John-
stone. Third, R. Blair. Highly Commended, J. Wilson, Beith.

ANY OTHER BREED.—First, Third, and Highly Commended, J. Sharp
(Owls). Second, J. Gray, Airdrie (Trumpeters).

SELLING CLASS.—First, J. Butler (Carriers). Second, Third, and
Highly Commended, J. Sharp.

EXTRA PRIZES FOR THE BEST PENS.—Prizes, J. Sharp (Pouters and Fan-
tails).

JUDGES.—Poultry: Mr. J. M'Innes, Paisley; Mr. A. Paterson,
Airdrie; Mr. A. Morrison, Glasgow; Mr. J. McLaughlan, Paisley.

Pigeons: Mr. J. Muir, Glasgow; Mr. G. White, Paisley; Mr. G. Ure, Dundee; Mr. J. Huie, Glasgow.

PIGEONS AT THE NEWCASTLE-ON-TYNE SHOW.

THE *Pouters* comprised some splendid birds. The most noticeable amongst them were the Whites of Mr. Fulton; both cock and hen were extremely good in all points. Next to these was a Black hen of splendid style, and the largest blower I ever saw, but rather deficient in limb. A Blue cock and a Red hen were also very fine. All the above won first prizes in their separate classes, and belonged to Mr. Fulton. In Yellow hens Mr. Stewart showed a splendid large hen, which was first, and Mr. H. Brown a fine hen, which had the second prize. Mr. Stewart also showed a very fine Blue cock, and a good Black cock. Yellow cocks were very poor in quality and numbers; Mealy cocks were strong in numbers, but deficient in quality; but some splendid hens were shown in the class for that colour, Mr. Sanderson's first prize Mealy hen being a very fine bird. Amongst the birds which did not take prizes, but were worthy of notice, were Mr. H. Brown's Red cock, Mr. C. Vaux's Blue hen, and Mr. Simpson's Blue hen.

For *Carriers*, Mr. Fulton was again first and second in both the classes with magnificent birds. Very fine birds were also shown by Messrs. T. Colley, J. C. Ord, W. R. Blenkinsop, and John Thompson.

Of Short-faced *Almond Tumblers* there were several beautifully coloured specimens. Messrs. Fielding, Fulton, Leach, Vaux, and Yardley all showed superior birds. For Any other coloured Tumblers the irrepressible Mr. Fulton was easily first with a splendid pair of Red Splashes; he likewise won the sweepstakes for the best Almond cock.

In the class for Black *Barbs* Mr. Van Haansbergen was first with a fine pair, the cock being a most superb specimen. In the class for Any-other-coloured *Barbs*, Mr. Firth won easily with Yellows, the hen being a very superior bird, the best of the colour I ever saw.

Among Red or Black *Jacobins* there was the closest competition, all the specimens being above mediocrity. I never saw so many first-class birds together. Mr. Jesse Thompson won with Reds, Mr. Pinder being second with Blacks. The latter were generally held to be the superior pair of the two, the cock being the best Jacobin I ever saw. Mr. Pinder showed another pair of Blacks, and very good birds were exhibited by Messrs. Van Haansbergen (two pens) and Horner, the hen in one pen, belonging to the former gentleman, being the best hen in the show. Of *Jacobins* of any other colour, only Yellows were shown, and they did not come up to the Reds and Blacks in quality. Mr. Horner's were the best.

Fantails (White) formed a large and very good class. Mr. J. Smellie's first prize pair were decidedly the most perfect specimens. Some immense-tailed birds were exhibited by Messrs. Edge, Leach, Else, Fawdon, and Taylor, and some marvels in carriage by Mr. Van Haansbergen. These extremely fine-carriaged birds were all more or less deficient in tail, as compared with those of Mr. Smellie. Some exceedingly good birds were shown in the class for coloured *Fantails*, Mr. Edge being first with very fine Blues. Messrs. Yardley, Martin, and Fielding also had very good specimens there.

Trumpeters looked well, Mr. Horner's especially so, and these were deservedly first and second in the class for *Mottles*. For Any-other-coloured *Trumpeters* Mr. Oates was first with a beautiful pair.

In the class for *Orls* Mr. Fielding was a long way ahead of all competitors both in Blues and Whites. Still, good birds were shown by Miss F. Easton and Messrs. Blenkinsop, J. Thompson, and Van Haansbergen.

Of *Nuns* there were several pens of excellent colour and marking, but in every pen but that of Mr. Croft one or other of the birds was deficient in crest. Those of Mr. Croft's were perfect. Mr. Horner's Yellows were very good.

Runts, Dragons, and Muggles call for no special remarks.

Of *Turbits* there was an excellent show. The crested birds laboured under the same defect as the Nun class; there were plenty of perfectly crested single specimens, but not one pair matched in this particular. The competition was very close, most of the birds being correctly marked, and of good colour. Messrs. Sale, Yardley, Edge, Towerson, Van Haansbergen, and Liddall all exhibited fine birds. In the class for point-headed *Turbits* the competition was just as close as in the crested class, and most difficult to judge. Mr. Horner was first and Mr. Fawdon second. Messrs. Leach and R. Wilson also showed good birds.

In the class for any other variety *Swiss* were first. Several pretty varieties were exhibited.—BORDERER.

TRIMMING VULTURE HOCKS.

UNDER a painful sense of duty I have followed up my letter the other day on this subject by entering a formal protest against a prize pen of *Brahma* hens at Birmingham. I am ignorant of the result, but if the penalty be not enforced I am willing to publish the case in your columns, signed by myself

and the two witnesses (both competent judges), in whose presence I took the bird from the pen.

There were so many clear cases in the cockerel class, that I feel bound to add I selected the hen class as the *only one* in which I did not myself show, in order that no suspicion of personal motive might attach to me in this my *first* active step. Business engagements also imperatively prevented my attending on Monday to support my protest personally, so that I was obliged to select such a case as would be obvious on inspection to the most inexperienced observer. If, however, justice be done in this case, it is my intention to take up *every one* which shall come under my notice, and thus endeavour to stamp out a practice which deserves the most unmitigated contempt.

I may remark, that perhaps the best pen of Buff *Cochins* was scandalously trimmed about the hackles to conceal the black feathers. But one matter at a time is quite sufficient for—NEMO.

NOTES ON FANCY PIGEONS.—No. 19.

BALDHEADS AND BEARDS.

THE various colours found in fancy Pigeons arose, as we all know, from selection and crossing. I say we all know, because the pretty-feathered, pretty-named German birds which have of late years appeared at our Pigeon shows have been bred in this way. Any colour and marking may be so obtained, as the German fanciers, who appear to be marvellously skilled in the matter, declare, and as all Pigeon fanciers have found to be true in a greater or less degree according to their experience.

With regard to Baldhead Tumblers, they were in the first place so bred without doubt. Many Pigeons run perfectly white in flight and tail, and parti-coloured birds usually have some white feathers in the head. Hence it was no great difficulty to obtain by care Tumblers which are very variously hued, more so than any of the fancy birds, white in flight and tail, and white also in head. The white feathers in the head would be most difficult to get free from any other colour, as those who, like myself, have specially bred Baldheads know full well; for in nest after nest the birds will come with one or two tiny coloured feathers where no coloured feathers ought to be, or the white extends too low down the neck, or the division there is not clean and straight, whereas the white feathers are sure to come right enough in wings and tail. The fancier who produced the first pair of Balds was, no doubt, highly pleased with them, and so would be every one who saw them, whether man, woman, or child, fancier or no fancier, as the little, snowy, well-shaped heads would strike and please every eye.

Old Moore (A.D. 1735), who only just mentions the beautiful Almond Tumbler, does not mention the Baldhead at all. In his day Tumbler beauty had not been developed in the same degree as Pouter beauty; but between his time and the publication of the "Treatise," thirty years after, Tumbler beauty had been greatly developed. Accordingly we find in the "Treatise" the first account of the Baldhead and Beard. The former should, it is well known, have a clean-cut, pure white head, white thighs, tail, and flight; in all cases a clear pearl eye. If the eye (of course dark for some time) of an adult is not pearl, or, as is sometimes the case, the bird is old-eyed, off with that head directly. There must not be a feather on leg or foot, not a dark feather on the head—if such appear off with that head too. If you wish to breed perfect Pigeons you must have no scruples as to killing, and no more weakness than Henry VIII. on the head question.

I remember, when ill in bed some years since, my great anxiety to see my young Tumblers' heads; so a party of birds was brought to my bedside on a waiter, which scene drew from me a smile, for how they waddled about and slipped upon the smooth surface.

Baldheads have much to recommend them. I have found them absolutely free from disease. They are little healthy plump fellows, with, like all Tumblers, plenty of brain, and capable of being made very tame, and are always sharp and knowing, picking through your fingers if a grain of hempseed is within the hand.

As to colour, I have always found the Black by far the best for many reasons. First, the contrast of colour when on the ground, the little white heads looking so very white emerging from the coal black body, and I think the Blacks are usually better shaped. Buffs are also very pretty, being daintily-looking little dears. Blues are often good, and very pretty, as all blue Pigeons must be, from the brighter hues on the neck and the very telling black bars. Silvers I think less of; there is little

or no contrast, and silver looks like a blue washed out—like a washed gingham gown. Red, if good, which it rarely is, is another distinct and excellent colour.

But next in regard to Baldheads when flying. The black and white with clean thighs look better when on the wing than any other Tumblers whatsoever; and during many years I have never had a Black Bald that did not tumble, the hens as a rule tumbling less than the cocks. At the same time I never had a Buff or a Red that did more than back, but not go over. I have seen some Blues tumble, but found it was the exception and not the rule. None of the latter-named colours look so well in the air as the Blacks; and considering the tumbling power of the latter it is no wonder that my preference has been for them, especially as they do not over-tumble like the Rollers. I imagine the Black is the genuine colour, and that the other colours were imported from some other Pigeon—a Turbit or Jacobin, perhaps.

If any one is in search of pretty ornamental pets—pets of very striking appearance, perfectly healthy, and giving no manner of trouble, I recommend him to breed Baldheads. A flight of all Black is very pleasing to the eye when on the wing, but if of all the colours procurable there would be variety; and the Reds, Yellows, and Blues look charmingly when parading the ground or basking on the roof.

I remember an amusing scene when I kept Baldheads with Antwerps. The little fat plucky Tumblers would try to keep up with these winged racehorses. Of course, it is best never to keep any other Pigeons with Tumblers, except a few Pouters, which show off the little fellows so well, and, not caring to fly much, do not bring down the Tumblers.

As to Beards, I think they must be regarded as less valuable, less striking, and less ornamental than Baldheads. Just a little dash of white running from the lower part of the beak, is not to be compared, I think, with the clear bald head. But the Beards are fine Pigeons, though rather cut-throats in look, and deserve to be cultivated; they are of the same colours as the Balde. Just as one fancier might take up with Baldheads, so another might take up with Beards. Tastes happily differ, and a lot of all the different colours offers a pretty sight. This, I think, unless you are a Croesus, and have immense lofts, is the best way to enjoy fancy Pigeons, take up a certain variety, and work it out and up thoroughly.

Both Balde and Beards make excellent nurses for the Short-faced Tumblers. I would recommend fanciers to breed flying Beards less coarse.

Among "Tumblers in general," I ought just to have named the Splashed, Mottled, &c.; in fact, there are Flying Tumblers of all colours. I must differ from some writers in regard to Tumblers having homing properties. My opinion is, that *uncrossed* by the Skinnaw, they have no homing properties at all. I have moved Tumblers two miles, not one returned; I have bought Tumblers one mile distant, they never went back to their former owner; I have bought Tumblers in the same town, and flown them, they never forsaking my loft. I believe you might buy them at one end of a street, and keep them at the other end, and in a month's time they would, if well fed, not return to their former home. Such is my opinion.—WILTSHIRE RECTOR.

P.S.—In regard to "R.W.'s" remarks, entitled "Tumbler Pigeons," I am sure he enjoys his pets, and deserves to do so, and he rightly describes the act of tumbling; but I am afraid he will never get the fancy to view the beautiful Short-faced birds as other than the highest class of their variety. Witness the prizes given to them, and the prices given for them, and the esteem in which they have been held for above a century; but of them more fully next time. Mr. Brent says, "Pearly eyes are essential for all Tumblers." I should never dream of keeping a Tumbler an hour that failed in this particular.

DISCOLOURED DUCKS' EGGS.

I CAN quite confirm the opinion expressed in page 412 as to the cause of the dark colour in Ducks' eggs at this time of year. I have a good many oaks about my place here, and my Ducks often have access to the falling acorns, and such eggs as were recently laid when the acorns were lying about were invariably thus discoloured—perfectly good and fresh for cooking purposes, but anything but sightly objects for the breakfast table. I have heard from other quarters that acorns were the cause, and my own experience quite confirms it. One oak tree overhangs the duckpond, and the acorns, as they fell, were

often seen to be greedily devoured by the Ducks.—ALFRED CROWLEY, *Croydon*.

JERSEY—ITS LIVE STOCK.

THE climate of Jersey, from its warmth and geniality, yet non-enervating character, is quite first-class for rearing live stock. Yet all kinds of live stock, except the celebrated island cattle, are still very far from first-rate. Those, however, who feel an interest in their prosperity must look at the improvement in them during the last few years, rather than at their present shortcomings.

The beautiful Jersey cows have always been bred with care, and protected in their purity by stringent enactments of the States, for no cow or bull of any other breed is allowed to land under any pretence. And wonderfully has this care and protection told upon the race. Twenty or twenty-five years ago really handsome cattle in a field formed a sight sufficiently rare to attract attention; but now any which are very faulty are quite the exception, and the beautifully ornamental little kine with the delicate head, the mild eye, the straight back and fine, sleek coat embellish almost every tract of pasture in the country. The old Jersey breed of cows was always famous for productiveness in milk and cream; they were fine in the head and limbs, with a soft eye and a crumpled horn, but faulty in many points. They were the origin of the Alderney race, having been sent there in 1798, and were used as a cross in the formation of that northern favourite, the Ayrshire breed. But it has been since the inauguration of the Royal Jersey Agricultural Society that the points have been settled, the breed brought nearly to perfection, and its price increased from £10 to £12 per head to sums ranging from £20 to £50 for cows, and from £15 to £70 for bulls. Heifers used to sell for £4 or £6, now they are from £12 to £25.

The points of the Jersey cow are, I believe, 36 in number. Genealogy, 2; those belonging to head, throat, horns, ears, and eye, 9; neck, chest, and form, 1; back, 2; tail, 2; skin and coat, 3; limbs and hoofs, 7; udder, teats, and milk vein, 1; growth, general appearance, and condition, 3: in all 36. According to Col. Le Couteur (a first-rate authority) the Committee of the Agricultural Society chose for forming a type the two best cows which could be found, and, from the fore quarters of one and the hind quarters of the other, drew a model of perfection which has never been bred up to in every point, but I believe within one of the goal has been attained. I can speak from experience of the produce of this beautiful breed. The beef is excellent, small, compact, and fine in flavour, and the milk is unsurpassed and unsurpassable, rich and sweet, but, of course, here, as in other places, sometimes tempered with. The butter is better than any I have known elsewhere, but it is not cheap, unless goodness be set down at money value. The price is generally 1s. 1d. at the cheapest period of the year, and it graduates from that to 1s. 8d. and even sometimes 2s. at the dearest. The butter is made up into round pats, tapering to the base, weighing 1 lb. each, and the Jersey pound consists of 17½ ozs. Stringent market laws enforce good weight. Any market woman offering underweight pats is not only compelled to forfeit her butter and her basket, but all such delinquents are marched in procession to convey the forfeited wares to the Hospital (where it is given for the use of the inmates), a distance of a mile or more through the town.

These pretty cattle are of the gentlest possible disposition, and although they are hearty they are not allowed to be wasteful feeders, for they are tethered in the pasture. The tethers are removed about three times a-day, and of course the feeding is clean and economical. The Jersey cow has been accused of being a great enter; but is it reasonable to expect a creature so productive as regards both the quantity and the quality of the milk to be other than hearty in appetite? Traffic in cows and bulls is quite a staple trade with England, America, and other countries. The last secretary of the Royal Jersey Agricultural Society was at great pains to establish a head book, which will of course tend in a valuable degree to the further perfecting of this beautiful stock.

The ragged, rough old Jersey horse had a valuable cross at the beginning of the present century with an accidental importation of Tartarian stallions, belonging to some Russian troops, which could not be landed in England in 1801, and Col. Le Couteur described the result of this cross in 1820 as "a hardy, active, fine-limbed animal, with a small head and bright eye."

but I think such horses are not seen here at the present time, and it seems a pity that the energy of breeders appears now to be devoted to racers, which, from circumstances, must be only second-rate, rather than to more generally useful qualities.

Sheep and pigs for the Jersey market are mainly importations from France, and they have the merit of supplying excellent mutton and pork, but it has always appeared to me that, with regard to sheep, this most enjoyable climate might be valuably utilised in the acclimatisation of the Merino sheep. I know that chickens, which can scarcely be reared in England without many deaths after every cold wet spell, thrive here, and from that I judge that the Merino sheep might do well in Jersey.

Many of the pigs which are seen here have remarkably fine ears, taking that word to apply to size, not to delicacy. The bristles, too, are stout and abundant compared with those on the animals we have been in the habit of admiring at the London and Birmingham Shows. Possibly, however, prize and useful qualities do not of necessity go hand in hand, for the pork in Jersey is excellent, and, I think, generally that which is bred in France and imported, is better in quality than that from the Jersey-bred pigs.—E. W., *Jersey*.

(To be continued.)

MANAGEMENT OF SUPERS.

HAVING during the past summer found great difficulty in inducing the pure and hybrid Ligurian occupants of several Woodbury hives to enter supers, both of glass and wood, any information on the subject, which several of your more successful correspondents are so well able to give, will be valued.

My first hive, supered on the 27th of April, was of wood, the super also; and the bars were furnished with pieces of guide comb. This hybrid colony never entered the super, but swarmed on the 16th of May, and again later in the season.

My next attempt, on the 27th of April, with a similar super on a straw hive, met with the same success, the bees swarming on the 16th of May.

The third, a pure Ligurian in a straw hive, supered on the 30th of May, a super with glass top and sides being used, and the bars furnished with guide combs, failed also. The bees being thickly at the entrance of the hive for weeks, never entered the super, and on the 30th of June, when I formed an artificial swarm, they had made no preparation for natural swarming, though the hive was full to overflowing.

During the summer I have supered seven hives, and have had no honey, the bees of two only having taken to the supers, and that too late to do much.

The coverings of my hives are of wood, as used by Mr. Woodbury, and the glass supers are always covered with a thick padding of cotton wool. The adapting boards are on Mr. Woodbury's plan, and my two apiaries, distant about two miles from each other, are well situated. The season in the neighbourhood has been above an average one.—A. E.

[We should be glad if "A RENSFREWISHIRE BEE-KEEPER," "B. & W.," or such other of our correspondents as may have had experience in supering, would advise "A. B." in his difficulty.]

FOUL BROOD—SWARMS FROM INFECTED COLONIES.

THE able paper on foul brood by "R. S." which appeared in page 372 of "our Journal" is noticed by "A DEVONSHIRE BEE-KEEPER," who, however, has had no experience of swarms from infected stocks, and has had no opportunity of ascertaining the result; it is, therefore, with great pleasure that I contribute my mite of practical experience with regard to the question of swarms carrying the disease with them. If the reader will refer to this Journal of January 2nd, 1868, it will be seen that I there stated that a swarm came off from a diseased stock during the previous summer. The stock in question was the only one out of many diseased colonies which I have had, wherein I saw any attempt made to clean out the polluted cells; so well did the bees do it, however, that when the young queen began egg-laying it might have passed for a healthy stock. Yet the first brood which was hatched out became diseased, and the colony was at once destroyed.

But to return to the swarm—it was put into a clean hive with

clean guide combs, and removed to a distant cottage garden, there to await the result. My other swarm was from a strong stock of black bees in which a day or two previously, two queen cells had been inserted. This young queen, and her attendants, were also put into a clean hive with waxed bars and undoubtedly pure combs, and sent away to the same cottage at a distance.

These two swarms were frequently examined during the autumn, but both remained healthy, and were in October fed up to moderate weights for the winter. Spring came, and with its sweet influence the beauties of Nature were never more fully displayed around here than during this year. The clover fields were in their prime by the 6th of May, and bees more forward than was ever known before. Swarms began to come by the 8th, and were general by the 14th.

The two stocks in question remained free from disease up to the 1st of May, and the old queen's stock was the stronger. On the 6th of June the latter swarmed, giving me the opportunity of thoroughly examining all the combs. To my great satisfaction I found every cell healthy. As the question of how many eggs does a queen lay in a season was then being discussed in "our Journal" and in the pages of a contemporary, I carefully measured all the brood combs, and, allowing forty-eight cells to the inch, found that this stock contained at the departure of the old queen 38,000 cells, filled with eggs and brood.

The other stock continued healthy up to the hot weather of July. On the 14th of that month the disease had broken out and was spreading rapidly, when the stock was at once destroyed.

I was quite discomfited at this terrible disease appearing in one of two stocks which appeared the least likely, and was in daily expectation of finding the other colony fall a prey to the same dire calamity. I often examined it, and had the great pleasure of finding it healthy up to the middle of September, at which time it ceased to breed. I still think I am not warranted safe, as the old proverb says, "It is better not to shout until you are out of the wood." So all I can do with this apiary is patiently to "watch and wait."

I may add that all my made-up stocks of last autumn, which are here at home, and most of which had queens given to them from infected colonies, remain one and all perfectly healthy. How they swarmed and collected honey in this year's brief honey season I leave for a future evening's scribble.—J. E., *Bracken Hill, Brigg*.

P.S.—I am quite of Mr. Woodbury's opinion, that on no account can chilled brood ever become foul brood. I have seen brood combs completely chilled, but they always dried up and were easy to clean out.

OUR LETTER BOX.

N.B.—Several answers are unavoidably postponed till next week.

NORTHALLERTON POULTRY SHOW (*H. L.*).—The rules you have sent are in no way applicable to your case. Consult a solicitor, and if you can obtain evidence that your birds were duly received, then the Committee might have to show what became of them, and your remedy would be in the County Court if they could not.

DUCKS' EGGS GREENISH (*Idem*).—It may be from acorns or other food the Ducks have eaten. See some remarks in the previous page. They are only objectionable in appearance.

HEN AND PULLET SUDDENLY DEAD (*Silver-Gray*).—They were in good condition, yet not overfat. There were no symptoms of poisoning. The crops were full of undigested barley. Instead of the last feeding being of barley or other whole corn, let it be of barley meal mashed. Give a little bread soaked in beer once daily during the winter. The fowls were fine, and evidence that a cross between the Brahma Poetra and Silver-Gray Dorkings produces good table birds.

BLACK HAMBURG COCK (*W. H. J.*).—We recommend you to sue the seller in the County Court. The needle thrust along the comb probably killed the bird. Send us a report of the trial, and we will publish it.

HENS KILLED ON RAILWAY (*T. P. Edwards*).—As the railway officials have acknowledged that the hens were "killed in transit," there seems to be no difficulty. Sue the Company in the County Court, if they refuse compensation.

TRYING UNSEEN PIGEONS (*Constant Reader*).—Never send a post-office order for Pigeons you have not seen. It would be, as they used to say in Cambridgeshire, "buying a pig in a poke." Name a referee, and let the advertiser write to him; you proposing that the birds should be sent to you for inspection, and if not approved you pay carriage.

TURBIT CHARACTERISTICS (*Idem*).—The points in Turbits are as follows:—Size, small; beaks, short; frill, large; head, broad; eyes, large and full. Judges now prefer a turn crown, or point crown, to the older smooth crown. In Blue Turbits the colour should be sound and good.

WEEKLY CALENDAR.

Day of Month.	Day of Week.	DECEMBER 10-16, 1868.	Average Temperature near London.			Rain in last 41 years.	Sun Rises.		Sun Sets.		Moon Rises.		Moon Sets.		Moon's Age.	Clock after Sun.	Day of Year.
			Day.	Night.	Mean.		m.	h.	m.	h.	m.	h.	m.	h.			
10	TH	Royal Horticultural Society, Promenade. 3 SUNDAY IN ADVENT.	46.9	32.6	39.8	25	57	af 7	49	af 3	21	af 3	16	af 2	21	6 46	345
11	F		46.1	32.7	39.4	17	58	7	49	3	34	4	41	2	27	6 18	346
12	S		46.1	37.3	39.7	18	59	7	50	3	47	5	16	3	28	5 50	347
13	SUN	Royal Horticultural Society, Fruit, Floral, and General Meeting.	46.9	32.5	39.7	23	0	8	50	3	55	6	55	3	29	5 22	348
14	M		46.2	33.3	39.7	19	1	8	50	3	56	7	34	4	30	4 53	349
15	TU		46.0	34.3	40.2	17	2	8	50	3	53	8	29	5	1	4 23	350
16	W		45.5	33.8	39.6	14	2	8	51	3	39	9	23	6	2	3 54	351

From observations taken near London during the last forty-one years, the average day temperature of the week is 46.2; and its night temperature 33.8°. The greatest heat was 63°, on the 12th, 1841; and the lowest cold 7°, on the 16th, 1833. The greatest fall of rain was 1.24 inch.

GROWING SHRUBS AS STANDARDS.

THERE is a host of plants in most shrubberies so prone to throw up suckers that they form a wilderness, especially at this time of year, constituting, indeed, a cage to catch the leaves as they fall, and thus occasioning no little trouble in taking these out. But this annoyance may easily be avoided.

Standard Lilacs, including the Persian Lilac, are very handsome when without the profusion of suckers which they are so prone to throw forth, and they are the easiest to grow as standards, except the snowball-bearing Gueldres Rose, which will make the most handsome standard imaginable. In good soil an old plant cut down will throw up suckers 7 or 8 feet high, with hardly a side branch. This and the common Lilac often throw up suckers, even without the old plants being cut down, sufficiently long to make such standards, but unless they are well disbudded, and rings of bark cut out, their natural tendency to produce suckers can never be effectually checked.

Ring the bottoms to facilitate the emission of roots must be done at, or a little after, midsummer; for if you ring them any time in April or May, and cover the cut parts, a communication is soon formed by a new layer of bark. It was on a large stool of the Lilac, with eleven strong suckers, and another of the common Privet, with eight suckers, that I first discovered that spring ringing has little influence in arresting the circulation, and I was rather surprised at the fact: but so it was, and as the whole went through my own hands I could not be mistaken. On referring to such authorities as I could then consult, I discovered nothing relating to this early ringing, and as to the theory of the practice I need not speculate now.

The common Syringa, *Philadelphus coronarius*, is another deciduous rambling shrub as prone to throw up suckers as the Lilac, but treated as standards it forms beautiful little trees, and the troublesome habit of producing a host of suckers is got rid of. They make elegant little trees like standard Roses for forcing in the spring. There are two other plants of this genus which ought to be in every shrubbery either as standards or huge bushes; their names are the Warded and the Broad leaved *Philadelphus*. These three flower early in summer. There is another species which does not flower till July, and on that account is valuable; besides that, it is a very handsome shrub—its name is *Philadelphus Gordonianus*. In their natural mode of growth these shrubs are little better than a Raspberry bush—indeed, they are more troublesome than ornamental; but train them as standards, and one could hardly believe how well they look.

The Berberry makes a handsome standard, but how seldom is it tried in that form, being only allowed to form a thicket of scrambling suckers, choking up the shrubbery like other plants of the same habit; yet when reared upon a clean straight stem, 5 or 6 feet high, it forms a very interesting little tree, particularly while in fruit. There is

another species called the Asiatic Berberry, which, if possible, is a still more interesting little tree, bearing bunches of purple berries in autumn. I have heard it highly recommended for underwood in plantations, for the purposes of sheltering and feeding game, for which use I think it well adapted: for no poacher could force his way through a thicket of it, as it spreads from the roots as much as the common Blackthorn. There are many other Berberries which, I think, would answer well as standards. I imagine it would be worth while to try some of the newer kinds of Berberry as standards, for I have not as yet seen any of them grown in that form. Perhaps others will give their experience on the subject.

The old *Corchorus japonicus*, or, as it is now called, *Kerria japonica*, with double yellow flowers, may be seen in every old garden in the country, growing after the manner of the Raspberry, but it would make a singularly beautiful standard if the stem did not rise above 4 or 5 feet high. The long slender branches first grow perpendicularly, and then bend over gracefully like plumes of feathers, and when in full blossom the weight of the flowers bears down the branches till their points nearly sweep the ground.

The genus *Spiraea* furnishes a host of plants which produce suckers in such numbers as to destroy each other. I never tried any of the species, nor saw them tried by others as low standards, but I am quite satisfied a great reformation could be made in their culture by getting rid of the suckers, and rearing the plants with single stems from 2 to 5 feet high, according to the growth. *Spiraea Lindleyana* treated as a low standard would form one of the handsomest plants that one could place out on the grass, and when not in flower might be mistaken for a Sumach tree.

Speaking of Indian shrubs, where could one find a better subject for a handsome standard than the beautiful *Lycetaria* of Dr. Wallich? It is a softwooded shrub, which caused a considerable amount of heartburning in this country some years ago, not having proved what it was at first reported to be, and is already almost neglected. It, too, never does well if allowed to take its own mode of growth, but elevate its handsome foliage, and its pendent clusters of flowers and fruit, on a clean stem 6 feet high, and I believe it will create a sensation in the neighbourhood. The plant has no English name that I am aware of, but commemorates William Leycester, formerly Chief Judge of the Bengal Presidency.

A book might be written on the subject of standard shrubs, and not exhaust it. These examples are taken from the most common shrubby plants, the most difficult subjects to deal with in any other way, and the least elegant in their modes of growth when allowed to take their natural course. Although I would strongly recommend this way of managing such plants, it is more for the purpose of remedying their propensity for throwing up a wilderness of suckers than for torturing their heads into globular forms like those of standard Roses. Indeed, I would rather let them assume their natural habit of growth, merely preventing any large limbs or shoots being formed to derange the balance of

their growth, and this is easily effected by stopping over-luxuriant growths occasionally, and by pruning the shoots in winter according to their size and strength—that is, the very short branches to be only a little shortened, the middle-sized ones to have one-half or two-thirds of their length cut away, the small spray cut out entirely, or cut in to a few eyes according to their position, and not allowing any branches or shoots to cross each other. This, of course, would be modified according to the way in which they produced their flowers after their heads were properly set off. What would our Gooseberry and Currant bushes be if they were allowed to pursue their natural growth? Their suckers would spring up as profusely as those of the Lilac, and their fruit would be comparatively useless. It is much the same with many of our ornamental shrubs, their flowers are in many cases only an apology for what they might be under a better system. We find no difficulty in forming our fruit bushes without suckers, and with clean straight stems, and we prune their heads in different ways accordingly as they bear best flower and fruit, and that is all I claim for our ordinary shrubs, which, as at present seen, are living examples of our negligence and bad gardening.

Standard bushes were made with great industry by our ancestors, and the practice is as old as the hills, but in those days they pruned and clipped them into all kinds of fantastic shapes, which are altogether foreign to our present taste. All that is original in this plan is the certain way of disposing of the contending suckers and side branches at once and for ever, from the collar to the head. Let the bole be of any length whatever, if it be prepared after the manner I describe, you may cut off the head ten years hence, and I will engage that the whole stem will die back inch by inch without the power of forming a single adventitious bud. Plants like the Lilac, which naturally have the power of producing shoots from the main roots, would, no doubt, produce suckers from these roots under such a severe trial, but certainly not from any part of the stem itself.—CHARLES ROBERTS, *Dorfold Hall*.

MARKET GARDENING ABOUT LONDON AND PARIS.—No. 3.

THE CULTURE OF ASPARAGUS.

"You can't get a head of Asparagus in Paris that is worth eating; it is hard and thick, with about an inch of eatable stuff without any flavour." "There is no question that we know nothing in England about Asparagus culture; if you want to get good Asparagus you must go to France." So say A and B, both knowing something about what they are talking of, yet, we see, coming to diametrically opposite conclusions. When they, doctors, differ, who shall decide? This I will not pretend to do, but will simply say what I think and what I know about the whole subject.

That Asparagus is a much more favourite vegetable in France than with us cannot be doubted. You will rarely find either a Frenchman or Frenchwoman who refuses it, while I have seen frequently at dinner tables in England, even when it is scarce, that a great many people never care to take it. This must to a great extent influence the supplies, and I believe does so to a considerable degree in the London market. There was a time when the market gardens of Bermondsey contributed large quantities to the London market, but the growth of the population has driven them away, while the more profitable though coarser Rhubarb has replaced it in other places. Still, if there were a very large demand, I think the laws of supply and demand are such that the blank would be supplied, and I can only conclude that other things, being found more profitable, are cultivated in its stead. Even when Asparagus is cheap, I have frequently seen in provincial towns that it remains unsold, simply, I believe, because the taste of the people is not for it. They may want "educating," but at present so it is; and I think it is utterly absurd to say that want of good cultivation is the reason that Asparagus is not more abundant. At the same time I am free to confess that there is much that we can learn from our neighbours in this matter, for as a rule their method of cultivation essentially differs from ours; and although much has been said and written upon the subject, additional observations made on the spot may not be out of place.

It was a broiling day at the end of June that, accompanied by M. Viret, I found myself at Argenteuil, the head quarters of the Asparagus-growing of the department of the Seine and Oise, for from there, Montmorency, and Pontoise, by far the

greatest portion of that which is to be found in the Paris market comes. At Argenteuil it is cultivated in two distinct methods—amongst Vines, and in plots by itself. The chief of all the Asparagus cultivators is L'Hérault; we spent some hours in going over his grounds, and in visiting some of those of his neighbours. The soil I found, generally speaking, to be a light friable loam, very easily worked, not clinging closely together and so becoming heavy, but free and open, giving plenty of play for the young rootlets of the Asparagus to run; and although much may be done with careful cultivation in any soil, yet without doubt the condition of that at Argenteuil is one reason of the very successful results gained. On this all the growers of Asparagus agreed, but not so on another point, about which I myself have great doubts. It is contended by M. L'Hérault that the first and chief consideration is the variety of Asparagus; that he has three of these, two of them—L'Ordinaire and La Hollande tardive, which are not peculiar to himself, but which he has improved by selection; and the third, La Hâtive, which he claims to have originated, and to which he gives the pre-eminence. I could see no perceptible difference in the plants of this as compared with other varieties, although without doubt the stems were larger than those in the neighbouring grounds; but in many of these the variety called La Hâtive was also cultivated, and therefore this difference was to be accounted for in some other way, of which more by-and-by.

The principal differences in the method of cultivation between French and English growers are two:—1st, In the separation of each stool, instead of allowing the stools to spread at will over the bed, as in England; and 2nd, Their cultivation in trenches instead of in raised beds, as with us; but this latter I look upon rather as a peculiarity resulting from the nature of the climate than from any other cause. Our greater humidity leads us to a method of cultivation which preserves the plant from too much moisture, while in France to obtain moisture is a matter of some consequence. I am confirmed in this idea by the fact that L'Hérault recommends the trench to be shallower, and that no "ades," or shelving side, is to be used when the ground is moist, and that he especially notes that drought is to be guarded against. Hence the difference is really in the separation of the roots, and I think there can be but little doubt that to obtain the greatest possible amount of value from each plant this is preferable, especially if the large heads are desired; but this, even with the French themselves, is a matter of opinion. There are really three distinct sizes to be seen in the Asparagus season—the "gros," the "gros grosse," and the "ordinaire." The second of these consists of those enormous heads which are supposed to display the skill of the cultivator, and which are sold for thirty, forty, and fifty francs a-bundle, and are mainly bought by the celebrated restaurateurs Verrey, Vefon, the Trois Frères, &c., whose pride it is to display in their windows the choicest productions in vegetables and fruits. The "gros" is not so large, but still vastly exceeds the greater proportion of the heads we see in the London market, or produce in our own gardens; while the "ordinaire" is somewhat like the best of our home-grown Asparagus. But in none of these cases is it considered right to have more than about 1 or 1½ inch of eatable matter, and this ought to be of a violet or rose colour when gathered. The very large Asparagus is obtained from the stools which are about seven or eight years old, at which time L'Hérault considers them at their best, and that after that they begin to decline.

With regard to their very large Asparagus I could not, seeing that the method of cultivation adopted all round Argenteuil is alike, and that the soil is similar, understand how it was that L'Hérault's was so much larger than others', and was inclined for a while to think that it must be, as he said, something in the variety; but on talking with another cultivator, speaking of L'Hérault's growth, "Ah!" he said, "we cannot afford to do as he does." "How so?" "Why, he goes over every one of his roots, and rubs off all those shoots which seem to be too small and defective, and only allows a certain number to each." So that, after all, it was the case of the Lancashire Gooseberry over again—only allow a certain number, and let them swell as much as they can. The great length of stalk as compared with the eatable part is simply the result of fashion. With us you rarely see a lady take a head of Asparagus in her fingers, although it is the only way to eat it, but in France it is universally done; and I confess, that although the fashion, I should not, were I a youthful Corydon, like to see Phillis take a great stick of Asparagus as thick as a constable's staff into

her pretty little fingers, and open her mouth as if she had to swallow a Potatoe whole. Corydon might do so himself, no doubt; but then man is "such a brute" generally, that an act of this kind would make but little difference. There is, perhaps, another reason for this. Some people do not like the very *prononcé* flavour of Asparagus; they merely want just the mild whiff of it, which occasions no inconvenience, and hence these blanched shoots are preferred.

The great point aimed at by the French cultivator is that of giving care and attention to each stool, and when the stools are a yard apart, as they ought to be to grow them on the Argenteuil system, this is easily done; and I believe that a modification of this system would be very generally adopted were gardeners to see the result. I would say, then, instead of planting a 4-foot bed of Asparagus as we do now, make two rows in the same space; plant about 2½ feet apart in the rows; let the subsoil be well worked; and plant in March. Do not use plants older than two years. L'Hérault strongly deprecates the use of three-year-old plants; he says they become broken, and take longer time to establish themselves. I should plant in very shallow trenches, so as to be able afterwards to fill in from between the rows, and thus give the Asparagus a little elevation. In planting I should do precisely as in potting an Auricle—heap up the earth into a little conical mound, and then spread the roots all round, adding, of course, some good well-rotted manure; then place a small stick, to which by-and-by the young shoots may be tied, so as to prevent the action of the wind; it will, moreover, enable you to see where the roots are, and consequently what misses you have. Do not put in the stake close to the crown, but at a little distance, and incline it at an angle towards the plant. In the autumn each plant should be examined, a little well-rotted manure placed on each, and covered over again. Keep all clear of weeds, and do not cut until the third year, and then only sparingly. Apply manure in spring and autumn, but not over the whole surface of the bed, but only over the stools. I have said "cut;" but on this point the Argenteuil growers are very strong. They insist that no knife should be used, but that simply the finger should be the gathering instrument, and the young shoot rubbed off instead of being cut. Where it is considered desirable to have a long handle to eat the Asparagus with, a little heap of mould should be placed over each stool; but I do not fancy that this will be in much favour here. Be always careful to have a sufficiently strong stake to tie the branches to that are left after cutting, and never cut these away until, at any rate, the month of October. If you desire to have the enormous heads one sees in Paris, it can easily be accomplished by thinning out the shoots in autumn and only allowing a certain number to perfect themselves.

The same care is not always taken. For instance, at Fontainebleau, near Montreuil, and at other places, I have seen the stools planted in trenches indeed, but the roots had been evidently allowed to run into one another as with us, but the special and thorough French plan is that pursued at Argenteuil and in the neighbourhood. I do not know whether it has a tendency to wear out the plants; but L'Hérault says they ought to be destroyed after fifteen years, while I know beds in England which have lasted a hundred, and are in as full vigour as ever. As a matter of personal taste I much prefer the small and green heads to the large and white-stalked ones of France; but *chacun a son goût*. One thing I believe is not sufficiently attended to in the preparation of Asparagus for the table, that is scraping it well. The forcing of Asparagus is carried on in other places, and will come under notice when I speak of the *primeurs* at Montrouge and elsewhere.—D., Deal.

HARDY FERNS.

MR. DOUGLAS, in his "Notes on Ferns," speaks of having obtained *Ceterach officinarum* near Godalming, in Surrey. It may interest him to know that here, in Somersetshire, on the Mendips, this Fern almost clothes many of the old limestone walls with its characteristic fronds, some of which attain a considerable size. *Asplenium trichomanes* is also abundant here; while the pale green of *Cystopteris fragilis* contrasts charmingly with the grey stones from between which it springs. A large space of the north wall of my garden is covered with it.

Asplenium adiantum nigrum is a pretty bright Fern, more common, I think, in Surrey than in this neighbourhood, but never found, I fancy, in very great abundance.

Blechnum boreale, or spicant, flourishes, with *Athyrium*

Filix-femina and the *Lastreas*, in the black peat of our hills; and among the smaller kinds of Ferns there is none more interesting, in its home, than *Asplenium ruta-muraria*, which grows side by side with *Ceterach*—sometimes in the same tuft.

Some of these Ferns are easy of cultivation, if their tastes as to soil, position, &c., are attended to, but *A. trichomanes* is very unwilling to be domesticated.

I must not forget to mention *Polypodium calcareum*, growing plentifully in the limestone *débris* at the sides of the road through the Cheddar Cliffs. It is an erect, branching Fern, with a distinct individuality, and one that readily adapts itself to a change of circumstances. In autumn its fronds die down, like those of the Lady Fern, Brake, &c.—G. H. T.

THE MERITS OF SOME BEDDING PELARGONIUMS.

So much has been said in the pages of this Journal in favour of some of these popular flowers, that I almost shrink from giving an opinion adverse to the acknowledged notions of some and what may be termed prejudices of others. We have certainly, during the last few years, had some fine introductions in this class of plants—varieties not only useful for the decoration of the conservatory, but also for the embellishment of the flower garden. It is my intention in these remarks to notice their qualities as bedding plants, and having in the past season had the opportunity of seeing some of the most recent introductions, as well as choice older varieties, bedded out together, I have made a few notes on their merits, and also on their shortcomings.

I do not intend to pursue any systematic arrangement, but will just make my remarks as from time to time I have jotted down my notes.

I will divide this large family into two sections; first, the Variegated section, and second, the Scarlet section, having horseshoe or plain leaves.

To begin with the Variegated section. Mrs. Pollock has for upwards of seven years held an honourable position, and has been a universal favourite. It will for a long time hold its place against such comers as Lady Cullum, Miss Watson, and others of the same class. I have not yet seen a leaf of Lady Cullum equal to the coloured drawing sent out last spring, that announced its advent, nor have I seen a plant yet of Miss Watson worth its carriage for a dozen miles. The latter is dwarf in habit, weak in constitution, and the colour of the foliage is a mongrel combination that is not effective.

Of the Golden-leaved and Bronze section I have as yet scarcely seen anything which answers to the glowing descriptions of the leading London catalogues. Beauty of Oulton and Beauty of Ribblesdale are not worth house room during winter for bedding purposes. Our old friends Cloth of Gold and Golden Chain have not been so effective as usual this season, nor have they made so much progress, owing, probably, to the excessive drought.

Among the Silver Variegated kinds I have seen nothing during the season to equal Pearl and Miss Kingsbury. Pearl, of first-class habit for bedding, has a broad white margin and a flat leaf-surface, with a slight shaded zone. I hardly like the zone, as I consider it rather detracts from than adds to its beauty. With this drawback—if such it may be considered—a bed of it at Mr. Pearson's Nurseries, Chilwell, by whom it was introduced last spring, was the most effective bed of Silver Variegated Pelargoniums I have ever seen. Miss Kingsbury is of different habit, yet very effective. It has a broad pure silver margin, with a rich dark green centre. These two Silver Variegated Pelargoniums I consider the gems of the season, and they only require knowing to be appreciated. Flower of Spring is a good old sort, and has been extensively used the past season. St. Clair I have long discarded, and when I can obtain a sufficient quantity of Pearl and Miss Kingsbury, such old sorts as Bijou, Alma, and Flower of the Day will follow in the same track. Italia Unita is very well as a pot plant, but it will never be appreciated for bedding purposes; besides, it is a very slow grower.

Coming to the Horseshoe section of Pelargoniums, we have a confusion of useless varieties for bedding purposes. Many sent out in the spring of 1867 and 1868, and described as "queenly varieties in all the essential features of habit and flower," have turned out to be no better than common garden weeds. The foremost of this character may be mentioned—viz., Christine Nosegay. Among others also left out to be

destroyed by the frost may be enumerated Rose Stella, The Sultan, Christabel, Mimas, and Le Grand, which last, though useful as a conservatory plant, is comparatively worthless in the flower garden. One of the most useful Scarlet Pelargoniums I have either grown or seen at other places this season, for beds or vases, is William Underwood. It is much in the same way as Lord Derby, though superior to it in all the essential qualities as a bedding plant. The flowers are bright scarlet, of immense substance, the trusses large and abundantly produced; foliage dark green, with a well-defined dark zone. I saw it at Wollaton Park, in the autumn of 1867, grown in vases, and nothing could be better adapted to the purpose. The plants were literally smothered with its noble flowers. This season Mr. Gadd, the gardener, has grown it again in the same place, in juxtaposition with Excellent, and though the latter is a fine plant for the conservatory, yet out of doors it was seriously affected by the sun, while William Underwood remained unscathed. I have myself grown it in vases this season, and I consider it as much superior to Stella, Herald of Spring, Indian Yellow, and Scarlet Gem, as Mrs. Pollock is to the old-fashioned though useful Golden Chain.

Bayard comes next in order as a first-class bedder, yea, it is even superior when grown in beds *en masse*. It is a crimson scarlet Nosegay, with a prodigiously free-blooming habit, large trusses, and beautiful dark green foliage. It is the greatest leap that has been made in this class of plants, and no remarks that I can make in its favour can be too laudatory. It has been stated by Mr. W. Paul, the Rev. Reynolds Hole, and other eminent horticulturists, to be the finest bedding Pelargonium in cultivation.

I may mention William Ingram, Alfred, and King of Scarlets, as possessing qualities of first-class excellence for bedding purposes. These three, also Bayard and William Underwood, were introduced by Mr. Pearson, of Chilwell.

For conservatory purposes I do not consider the five above named superior to such as Lord Derby, Excellent, Chilwell Beauty, and Dr. Lindley. Rebecca is also a beautiful pot plant, with a peculiar shade of colour, fine round petals, and large trusses, though I have not yet seen it bedded out. Lucius is fine as a pot plant, with immense trusses of bright, rose-coloured flowers. I have not yet seen it employed in the flower garden, yet a plant of in our kitchen window, under the management of Mrs. R., is a perfect gem. Amy Hogg is too well known to need comment; Chilwell Beauty is not distinguishable in colour, but much finer in flower and truss.

Speaking of the Pink section, Christine and Helen Lindsay have long been favourites, but these give place to Maid of Kent. Rose Rendatler I have long grown and appreciated for in-door purposes; yet Maid of Kent, both for in and out-door cultivation, is far in advance of all others that I know in its class of colour. I could not really understand Mr. Luckhurst (page 144), in his select list, when he said that "Christine, Rose Rendatler, and Helen Lindsay were still unsurpassed for the decoration of vases, &c.," and then mentions Maid of Kent as being something not equal to the above-named; at least, that was the inference I drew from the statement.

Of the Salmon-coloured, Madame Rudersdorff shines forth pre-eminent; and of Whites, either for beds, pots, or vases, Virgo Maria is still without a rival.—Q. R., *Pleasley Vale*.

TRAPPING WOODLICE—EXCLUDING SLUGS.

UNTIL I discovered the following plan for trapping woodlice, I suffered much annoyance and loss from their ravages. I tried all the suggestions that I saw recommended in your valuable Journal, but found that our colonial insects either did not appreciate potato, &c., or were more knowing than those in the old country. However, I thought I would try sinking a tumbler in their haunts, and I found it most satisfactory; and now, whenever I am at all annoyed by them, I insert a small propagating glass into the soil or plunging material, leaving the edge a shade lower than the surrounding stuff, and in a few nights I have had a 4½-inch glass half full of woodlice, earwigs, and other abominations. They may either be left in to perish, or be emptied every morning.

I also find a ciclet of zinc fastened with a single copper rivet a certain protection against slugs. I cut old zinc lining of cases into strips about 4 inches wide, and then make the ciclet of whatever size I wish. Whether the slugs object to zinc, or whether there is a galvanic current established, I do not know, but I have never known a slug to get inside one of

these without being able to show some other way than by climbing over the sides.—SOUTH AUSTRALIAN.

CONSEQUENCES OF LAST SUMMER.

THE effects of the late tropical summer are now showing themselves here, especially amongst the Rhododendrons. Many of them during the drought were to all appearance dead; but when the autumn rains set in they revived again; some began growing, and are still doing so. Should severe weather occur I fear the young growth will be destroyed. Others came into flower, are still flowering, and are likely to continue so for some time. They look quite gay at this dull season; but I am afraid it is at the expense of our spring and summer display. To be deprived of the usual display of Rhododendrons would to me be a matter of much regret. Some plants are making their appearance above ground, as Colchicum, Tritoleia uniflora, Bulbocodiums, and others, which do not usually appear until spring.

I find that of late the caterpillar, so destructive last winter amongst Scarlet and other Pelargoniums, has again made its appearance. It is only to be kept in check by diligently searching for it.

PLANTS IN FLOWER DURING NOVEMBER.

Lycosteria formosa	Zauscheria californica
Phlox stolonifera	Plumbago Larpenae
Arabis albidia	Campanula rotundifolia
Schizostylis coccinea	garganica
Jasminum nudiflorum	Chrysanthemums, Japanese
Viola odorata	Salvia horminum purpurea
Double Daisies	Pyrethrum parthenium
Erica ramentacea	Mirabilis jalapa
Corydalis lutea	Mignonette
Konigia maritima	Gynierum argenteum
Virginian Stock	Sedum caruleum
Rose, Crimson China	Sweet William
Gloire de Dijon	Primrose, Double Crimson
Monthly China	Silene rubella
Fabvier	Oenothera taraxacifolia lutea
Arctotis breviscapa	Rhododendrons
Veronica hybrida	Sedum telephium
Onthalodes verna	dentatum
Polyanthus Fire King	Vinea minor
Veronica syriaca	Cheiranthus fraticulosus
Primrose, Double Lilac	Marigold
Hepatica triloba	Gazania splendens
Ten-week Stocks	Viola cornuta
Salvia fulgens	montana
Chrysanthemums	Anemone japonica
Anchusa sempervirens	Armeria rubra
Corydalis glauca	Viola tricolor
Antirrhinum	Campanula pusilla
Aster tenellus	Common Ivy
Cineraria maritima	Sedum trieloidi
Crucianella stylosa	Gilia tricolor
Cuphea platycentra	Arbutus hybrida
Rhododendron dauricum	Daphne laureola
Erica carnea	Ilex canariensis
Fuchsia coccinea	Viburnum tigris
Erinus alpinus	hirtum
Lupinus albo-coccineus	Andromeda polifolia
Gaiothera macrocarpa	Achillea millefolium rosea
Pentstemon Shepherdi	Viola lutea
Tritoma uvaria	Rose, Niphotos
Verbena venosa	Coronilla varia

—M. H., *Acklam Hall, Middlesborough-on-Tees*.

ROSE SEED PROSPECTS.

THE present golden harvest of Rose seed is most encouraging to the English grower, and though the past intensely hot summer may have injured the tall Briar stems, this season must long be remembered with gratitude, as giving us seed beds of as much interest and importance as to our French neighbours. I feel sure I have only to mention even our Torquay ingathering from the rosery, to gladden the hearts of many of your readers. It was:—from Alfred Colomb, upwards of two quarts of fine ripe hips; from Pierre Notting, rather more, and remarkably fine; from Charles Lefebvre, Prince Camille de Rohan, and Souvenir de Dr. Jamain, a large quantity. Seed was also produced by Baron Gonella, Dr. Andry, Jules Margotin, Madame C. Crapelet, Madame Falcot, Blahiri No. 2, Fisher Holmes, Madame Knorr, Madame Victor Verdier, Catherine Guillet, Gloire de Dijon, Safrano, Duchesse de Caylus, John Hopper, Senateur Vaise, Souvenir de William Wood, Xavier Olibo, and many others.

I have never been able to obtain a ripe seed before from Gloire de Dijon, or from (the queen Rose for scent) Madame Knorr, or John Hopper.

Dark Perpetuals appear to bear seed more freely than the light kinds. The very hot summer of 1846, produced a large harvest of Rose seed, and I have now before me a memorandum of the varieties, forty of them, among which I see nine were Hybrid Perpetuals, at the head of which stand Madame LaFay, Mrs. Elliott, La Reine; seventeen Bourbons, and fourteen Hybrid Bourbons, but fully three-fourths of these have now passed away from our lists.

In conclusion, I would press on our French friends not to grow any more reds or darks for us after the present season, but devote their immediate and utmost attention to the production of white-striped and yellow Perpetuals. I sincerely hope they will take this advice, as they will find it very profitable to themselves and us.—HENRY CURTIS, *Devon Rosery, Torquay.*

ARRANGING AND PLANTING SHRUBS.

(Continued from page 340.)

Deciduous shrubs ought not to be removed so early as evergreens; their wood should be ripe, their growth at an end, and their leaves falling or fallen. From that time to the swelling of the buds in spring is a good period for planting deciduous shrubs, but the operation should be done in mild weather only, and the earlier in autumn the better. Avoid planting whilst the ground is a soapy mass, as it generally is for some days after a thaw, and above all secure the shrubs from high winds, for if they are moved to and fro the rooting is retarded, whilst by securing the head the roots are maintained in the position given them at planting, and the new fibres are then not liable to be broken and destroyed.

If planting is practised early in autumn or late in summer, also late in spring, the shrubs should have a good watering afterwards, and water may subsequently be given as required, but not until the soil is becoming dry, for nothing so injuriously affects the rooting of a shrub as saturating the soil with water. Instead of watering newly-planted shrubs so frequently at the roots, as is sometimes done, it would be far better to sprinkle the head with water from an engine two or three times. So long as the soil is moist, giving water, instead of promoting the rooting, hinders it by causing the roots to imbibe water through the cuts or broken portions, and then the waste by evaporation from the leaves is not so well restored as it would be by sprinkling overhead.

It is well not only to properly prepare ground for planting, but to be careful in the selection of the shrubs. Some like strong plants, and generally choose those which have made good growths. Now this is a mistake. Strong growths are one of the greatest evidences we have of the shrubs not having been recently transplanted, and unless they have been, the chance of successful removal is doubtful, and still more so that of their growing well the first year. I am no advocate for the planting of large shrubs at any time, and I would submit that unless they have been removed every second, or at least every third year, the chances of their growing are small; and the same remarks apply to shrubs of less size. If the shrubs have not been transplanted every two or three years, have not had space allowed for their growth, so as to be sturdy and well furnished, their roots are bad, long, and fibreless, and such plants are not worth the trouble of planting. Years must elapse before they attain a good size. No better criterion of the value of the two kinds of plants can be had than their commercial value: shrubs frequently transplanted and allowed room to grow are worth twice as much in the market, and to the planter they are the only ones worth his notice.

The distances adopted in planting are determined by circumstances and the habit of the shrubs. If immediate effect is wanted more must be planted than are intended to remain; but in this case, those which are to be permanent must be planted in their proper places. Shrubs of spreading habit, when planted for individual effect, should be allowed a distance apart equal to the height they attain; for groups of one species, varieties of one species, or species of one genus, half the height to which they grow will be suitable; whilst shrubs of upright growth, as the Irish Yew, may be planted no more than half the height they will reach apart. Their distance from the edge of the grass or walk should be half the height they usually attain. Though immediate effect may have due consideration, it is, nevertheless, desirable to place the permanent plants at once, and leave them to their proper growth. In any case, the permanent specimens must have the first consideration; they must all be placed, and then the planter

can fill up with such shrubs as may be removed with safety when the permanent ones require the whole of the space.

The tallest shrubs should be placed at the back of the borders, or in the centres of the groups or masses, and the dwarfier sorts in front; and however irregular in width the border or mass may be, the same breadth of the dwarf-growing shrubs must be allowed the entire length of the border and all round the masses. It is a prevailing fashion to border shrubberies with flowering plants. This is productive of anything but a good effect. If the object were producing a picturesque effect by mixing trees, shrubs, and flowers indiscriminately together, then the present general practice of fringing borders and masses with flowering plants would admit of justification; but the shrubs being rival objects, and offering a great impediment to the flowers arriving at perfection, they ought not to be planted where these objections exist. Flowering plants—I mean herbaceous plants—from the shade of the shrubs and the occupation of the soil by their roots, do not nearly attain the perfection they are capable of, and they ought not to be planted where they cannot attain it; besides, the effect of shrubs is very different from that of herbaceous plants—distinct in expression, and they ought to be kept so.

It now only remains to offer a hint as to the grouping of the different shrubs. Mixed borders have always a motley appearance, and are poor as compared with masses. I would, in all cases where duplicates have to be planted, plant these together, assorting them according to colour of foliage, of which there are many shades, and of flowers, preserving lines or masses of one colour with a view to harmony and contrast.—G. ABLEX.

FERN FRONDS DISFIGURED

On looking through the "Answers to Correspondents" several replies will be observed, which seem to refer to the above evil, suggesting that it is most probably caused by the thrips. This, however, I have unfortunately very strong reasons for suspecting to be not the case, but that instead of being due to thrips it is owing to one of our more recently introduced pests, which, I am afraid, will prove to be a far more formidable enemy, as it does not seem disposed to succumb readily to any of the ordinary means now in use. The little wretch in question is a small white fly about the twelfth of an inch in length, and during the summer may be observed sitting with its wings folded over its body on the under side of the leaf. It has been known in our gardens for some years past, and is sometimes designated "the cloud fly" from its issuing in clouds from the bushes when they are shaken. It was at first thought to be harmless, but this was found to be a mistake, yet it appears to have been only within the last few years that its depredations have become so serious under glass. It has now disappeared for the winter, but when it first reappears in the spring it will then be advisable to attempt some energetic measures for its suppression.

An answer headed "Destroying White Fly" is given in No. 345 of this Journal (vol. xiii., New Series) explaining the escape of the insects from the effects of tobacco smoke, by falling to the ground out of its influence, and suggesting a wet floor to receive them; but this latter is not always practicable. A good plan where it can be done is to strew the floor with wet sawdust or sand, then after smoking sweep it up, and burn it as speedily as possible. I have found incessant syringing from an open nozzle with the finger over it so as to produce a fine but powerful stream, have some effect in driving the insects away, and thus lessening the mischief produced; but this is weary work, and in very damp weather not always desirable. It is to be hoped, when attention has been drawn to the character of the pest, that it will not be long before some easy and effectual means will be found for its extermination.—W. KENCZLY BRIDGMAN.

CULTURE OF THE DOUBLE ITALIAN TUBEROSE.

The Double Italian Tuberose (*Pollanthes tuberosa flore-plena*), is not very often cultivated; in fact, it is a plant that a great number of gardeners are unacquainted with, yet it is worthy of cultivation for the sake of its deliciously-scented white flowers, which resemble in some degree those of the *Stephanotis floribunda*, if one could suppose a double variety of that popular stove plant. The flowers of the Tuberose are arranged in pairs on stalks from 3 to 5 feet long. Indeed, the long flowerstalks are rather objectionable, and there are seldom

more than two pairs of flowers expanded at one time on each flowerstalk. As the first-expanded flowers fade, the stalk lengthens, and a great many pairs are produced.

This plant is easily cultivated, and the bulbs may be purchased at a cheap rate. The largest bulbs must be selected, as small ones sometimes do not flower, and if they do, will not give satisfaction.

I pot three roots in a 6-inch pot, using for soil a mixture of two parts turfy loam and one part well-rotted cow manure, with a small portion of silver sand to make the compost porous. The best situation for the pots is a Cucumber frame, where they may be plunged to the rims in the material in which the Cucumbers are planted. A bottom heat of 85° or 90° suits the Tuberoses very well. They ought to be kept in the frame until the flowerstalks appear, when they may be removed to the greenhouse, and allowed to flower there.

They succeed very well in ainery, but I do not recommend them to be grown there, as they are very liable to be attacked by red spider, and will undoubtedly introduce that unwelcome visitor. In the greenhouse they may be set so that the flowerstalks show above the foliage of other plants. They are also suitable to place in the entrance hall of the house, where scented flowers are appreciated.—J. DOUGLAS.

THE HYBRID COLEUSES.

DURING my visit to the great June Show of this year at South Kensington I first saw the collection of new hybrid Coleuses. Beautiful indeed they looked; I was charmed with the lovely foliage there displayed. No doubt eventually, when their value shall have been known and proved, they will prove invaluable both for in-door decoration and for bedders. For dinner-table decoration they are exquisite. To see them to perfection is by the aid of the chandelier; the contrast between the tablecloth and the lovely dark foliage is charming. They are so easily propagated that they are within the reach of every one, and no doubt as they become better known they will be more popular than they are at present.

Coleus Saundersi is of a deep chocolate purple in the centre, somewhat mottled, and of a pale bronzy tint towards the edge, which has a broadish band of green broken through with purplish bronzy reticulations; under surface blotched with purple in the centre. Stems green, blotched with purple. I have had some of the leaves as broad as the palm of my hand. It is a plane-leaved variety.

Coleus Marshalli—One of the best of the set. Rich chocolate purple; the base of the midrib and the crenatures green, so as just to form a narrow green margin. Stems green, stained with purple at the nodes.

Coleus Dixii.—Leaves dark chocolate purple in the centre, feathering out through the broadish bright green margin, which is nearly an inch wide; the crenatures narrowly purple-edged.

Coleus Berkeleyi.—Leaves, both above and beneath, of a rich velvety chocolate purple, the tips of the crenatures only being green. Stems green, slightly speckled and clothed with purplish down. This is a beautiful and richly-coloured plant, in which nearly the whole surface is of a velvety purple hue, which is well displayed, from the flatness of the foliage.

Coleus Murrayi.—Leaves green, pinnately marked along the principal veins with bars of dark purple, which sometimes coalesce, the rest of the surface showing through from beneath the purple reticulations, which are evenly and strongly marked on the under surface. Stems purple. This is a more regularly and more fully coloured form of *C. Gibsoni*, and, therefore, an improvement.

Coleus Ruckerei.—Deep purple throughout on both surfaces. Stems purple. A fine, sturdy-growing, dark-leaved sort, having very much the colour of the *Perilla nankinensis*.

Coleus Batemani.—This is a frilled-leaved variety, deep purple, here and there very slightly mottled with green. Stem purple.

Coleus Bausei.—This charming variety is one of the best. I have had leaves that would cover my hand, of a rich velvety chocolate purple, green towards the base, and at the extreme margin; under surface slightly blotched with purple. Stems green, purplish at the nodes. Very richly coloured, the dark colour nicely relieved by the slight green margin which lightens up the whole plant.

Coleus Clarkii.—Leaves' centre green, with the fringe purple. One of the darker-tinted sorts, having the markings of the reticulated character.

Coleus Wilsoni.—Leaves of a rich velvety chocolate, shaded with purple; the base of the leaf and the fringe slightly tipped with the same colour. A very elegant mottled variety, quite distinct.

Coleus Scotti.—Leaves bright green, everywhere traversed by deep purple veins, here and there coalescing into blotches; the under surface similarly marked, but of a brighter colour. Stem purple. A very elegant variety, having the markings of a deep tint of purple, but well relieved by the green spaces between the dark-coloured reticulations.

Coleus Reevesi.—Frilled with coarse wavy teeth, green, mottled with bronze and purple, sparingly dotted at the base, and laid on in close reticulations and patches towards the edge, the centre being deeply tinted and entirely of a dark colour, and the teeth green, with narrow purple edges. Stem green, blotched with purple.

Coleus Telfordi aurea.—Leaves of a yellow colour, with a blotch in the centre of each leaf. This variety does not do well with me. I do not consider it worth growing. It is very much after the style of *Plectranthus concolor*, but not nearly so good. All the others are doing exceedingly well, and are everything that I could wish.

I read the announcement of another set, shortly to be sold, said to be superior to any of the previous varieties. If they are, they must be good indeed.—F. P. L.

MUSHROOM CULTURE.

I HAVE hesitated about writing respecting Mushroom culture, so much has been written already; but my plan is so simple and successful that I must state it and the results.

The place in which the Mushrooms are grown was originally the stokehole for two of Weeks' tubular boilers, which are now removed some distance from the houses, and the sides of the underground stokehole have been converted into beds for Mushrooms; the end boarded-up for Sea-kale. There are two 6-inch flow and return pipes from the boilers, 40 yards off, to heat a block of seven houses, and these two pipes pass through the old stokehole under the arched roof.

The first bed was made October 5th, from droppings collected from the stable, which had been placed in an open shed and kept turned until there was a sufficient quantity. They were then put in the bed, well beaten down, spawned when the heat was on the decline, at 85°, and soiled with 2 inches of stiff yellow loam. The first dish was gathered November 10th, and since that time I have had thirty-one dozen from a bed 9 feet long, 3 feet wide, and 10 inches deep. I have just gathered five dozen more. There are 110, averaging 3 inches across the top, fit to be taken, and the bed is completely white with small Mushrooms the size of peas and upwards.

The second bed, spawned November 5th, is showing the little globules all over. I have made two more beds for successions, with room for eight more of the same-sized beds, so there will be no lack of Mushrooms throughout the winter. Of the 110 I have cut six which weighed 9 ozs.—J. C. MUNDELL, *The Gardens, Hooley Hall*.

BARBAREA VULGARIS VARIEGATA AS A WINTER DECORATIVE PLANT.

As one much interested in hardy plants presenting a showy appearance in winter, I beg to thank "Ayrshire Gardener" (page 417), who mentions one to which I confess being a stranger, but from the description given of it, I would be glad to have a closer acquaintance with it, as it is evidently one of those plants of easy culture which commend themselves more especially to those who want a great number of suitable plants with as little trouble in cultivation as possible. Presuming this plant to be a Winter Cress, as the generic name implies, its foliage I take to be a nearly pinnated leaf, of considerable beauty in the green form, but of much greater beauty in the variegated one, and being thickly set on the crown of the plant must, as the writer says, be very attractive in winter, excepting when enveloped in snow. The latter, of course, overwhelms everything, and we must not be deterred from growing the plant in consequence of that; and as ornamental plants for winter use are not at all numerous, especially such as are really attractive from, say, the middle of November to the middle of March, a period of four months, I, for one, will be glad of anything that can be worked in to advantage during that time. After the latter period comes spring, when we

may expect bulbs, Primroses, and other early flowers; but in the dark days we must be satisfied in general with gazing upon ornamental-looking plants, and as only such as can bear 20° of frost are suitable, their number is far from being great.

For some years I have urged the claims of winter gardening instead of that of spring, because of the much longer period that the one has to do duty than the other. Under the best of circumstances and with the best possible selection of plants, it is seldom that much display is made in spring gardening until April. Crocuses and Primroses may have been in some time before that if the winter has been mild, and the first-named as well as Snowdrops may have all flowered during March, but even if they should have done so, what was there to look at in December and January, and often long after that? This prolonged interval may certainly be turned to better account than is often done; and as plants having a light-coloured or variegated foliage form the best contrast with the dark-coloured damp ground, any possessing foliage of such a character are acquisitions. I hope, therefore, to hear something more of this plant, and I will again advert to winter gardening and the plants suitable for it.—J. ROBSON.

POMOLOGICAL GLEANINGS.

We never had more striking evidence of the influence of an orchard house over the quality, size, and beauty of fruit than was afforded by two Apples, part of the crop grown at Hamburg, in the orchard house of Mr. Johann Wesselhoeft. One of the Apples, the White Calville, is well known as a large and excellent dessert fruit; but the specimen sent was larger than large, for it measured 14 inches in circumference, and in every other merit surpassed those we have had from an open wall. The other specimen was of the Melon Apple, and this was the largest we ever saw of the variety, being 13½ inches in circumference, most brilliantly coloured, and all that a culinary Apple should be—flesh high-flavoured, and cooking tender.

—A CORRESPONDENT, "E. M. B. A.," writes to us as follows:—"In the interesting account given in the Journal of the 'DOYENNÉ DU COMICE PEAR,' I venture to think that either the writer or the printer of the article in question has fallen into a mistake in accenting the last letter of Doyenné. Turning to Contanseau's French Dictionary I find as follows:—'Doyen, s. m., 1, dean; 2 (of age), senior. Doyenné, s. m., 1, deanery; 2 (Pear) Doyenné.' The explanation of the latter word rather implies that Doyenné is correct; nevertheless, it seems to me that Doyenne should be regarded as the feminine of Doyen, the word *poire*, which is feminine, being understood. *Comice* is evidently derived from the Latin word *comitium*, an assembly; so that 'Doyenne du Comice' must mean 'Dean of the Assembly,' a title to which, from the account you give, it is justly entitled. It can scarcely be maintained that any one should name a Pear 'the Deanery of the Assembly' instead of the Dean—i. e., the Chief of the Assembly. The one makes excellent sense, the other is little less than rubbish."

[All authorities, French and English, place the accent on the last letter of Doyenné, and, we think, correctly. The first Pear so named was raised in the garden of a French deanery, and literally means "the Deanery Pear." Since then many Pears resembling it in some one or more qualities have received the same name, with some affix to mark that they are differing. Thus we have the Doyenné d'Alençon, or Deanery Pear of Alençon; Doyenné d'Autonne, or Autumnal Deanery Pear; and full twenty others. Doyenné du Comice we believe is the Deanery Pear of the Committee, it having obtained the special approval of the Committee of the Horticultural Society of Angers.]

ENTOMOLOGICAL SOCIETY'S MEETING.

IN consequence of a recent arrangement the meetings of this Society are now held twice in most of the winter months, and are discontinued during the autumnal ones, instead of taking place once a-month throughout the year as heretofore. The second meeting was accordingly held on the 16th of November, the chair being occupied by the President, W. H. Bates, Esq. Amongst the donations received since the last meeting were various American publications on Natural History, which clearly proved that a great movement in the study of the natural sciences is taking place in the United States. The Lyceum of New York, the Natural History Society of Boston, the Entomological Society of Philadelphia, and the Essex (U.S.) Institute, were amongst these Societies.

Mr. Frederick Bond exhibited specimens of one of the Plant Beetles, *Chrysomela polygoni* (Phædon polygoni, Steph.), of which immense

numbers had occurred in various parts of Cambridgeshire in the middle of the month of September, crawling about the footpaths in such profusion that they might have been collected by bushels. The larvæ on a previous occasion had been found to be very destructive to Tares. He also exhibited a specimen of *Polia nigro-cincta*, one of the rarest of the British Noctuidæ, from the Isle of Man; *Dianthæcia capnicola* variety, from Warrington; and *Tapinostola Elymi*, from Norfolk.

Mr. McLachlan exhibited a series of specimens illustrating the entire history of one of the most remarkable British insects, *Enoicyla pusilla*, a species belonging to the order Trichoptera, containing the Caddice Flies, but differing from every other recorded species in being terrestrial in the larva state, feeding upon damp Mosses and Lichens, and forming a small, moveable, trumpet-like case, in which it resides, and from which the perfect insect is developed in the months of October and November, the males being furnished with full-sized wings, whilst the females are wingless, thus resembling some of the small case-making species of Moths. The insect had been discovered by Mr. Fletcher, near Worcester.

A specimen of *Papilio Machaon*, captured near Rapert House, Hudson's Bay, was exhibited, being the first instance of that species having been taken in North America, although a closely allied species (regarded, indeed, by some writers as a local variety), occurs in California not infrequently. It was also stated that *Pontia Rape*, one of our commonest European insects, had been introduced within the last thirty years into North America, where it had become greatly disseminated in Maine and Vermont.

A prospectus of a new general specific and synonymical Catalogue of the Diurnal Lepidoptera, by Mr. Kirby, was distributed.

The Secretary read an article by Dr. Perkins, on the luminous species of Elateride found in the New World, where they are known under the common name of Cucujo.

Professor Westwood exhibited drawings and dissections of several new and anomalous exotic Hymenopterous insects, including a new genus which had been referred to the families of the Ants and Sand Wasps, but which the author considered more nearly allied to the Vespidæ. Another new genus was also described, nearly allied to the curious genus *Trigonalya*, of which, also, three new beautiful species were described. He also stated that the new British Noctuidous Moth, recently captured at Folkestone by Mr. Briggs had proved to be *Leucania albi-macula*.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

ONCIDIUM MACRANTHUM (Large-flowered Oncidium). *Nat. ord.*, Orchidaceæ. *Linm.*, Gynandria Monandria.—A magnificent species. Native of Peruvian Andes, at an elevation of from 1000 to 14,000 feet. Flowers yellow and purple.—(*Bot. Mag.*, t. 5743.)

PARROTIA PERSICA (Persian Parrotia). *Nat. ord.*, Hamamelidaceæ. *Linm.*, Pentandria Digynia.—One of the rarest trees in cultivation. Native of Northern Persia. Its special beauty is the foliage, which late in autumn is gorgeously orange, golden, and scarlet, and hangs long.—(*Ibid.*, t. 5744.)

CAMPANULA ISOPHYLLA (Ligurian Campanula). *Nat. ord.*, Campanulaceæ. *Linm.*, Pentandria Monogynia.—A very beautiful, rare, hardy herbaceous plant. Native of Liguria, between the Gulf of Tuscany and the Apennines. Flowers blue.—(*Ibid.*, t. 5745.)

LYCHNIS LAGASCE (Lagasea's Lychnis). *Nat. ord.*, Caryophyllaceæ. *Linm.*, Pentandria Monogynia.—One of the most rare and most beautiful of our rock plants. Native of North-western Pyrenees. Flowers rose-coloured.—(*Ibid.*, t. 5746.)

AGALMYLA STAMINEA (Long-stamened Agalmyla). *Nat. ord.*, Cyrtandræacæ. *Linm.*, Diandria Monogynia.—Native of Java. Introduced by Messrs. Veitch & Sons. Flowers scarlet, with yellow throat, and purple stamens.—(*Ibid.*, t. 5747.)

MADRESFIELD COURT BLACK GRAPE.—"This Grape is worthy of the warmest commendation both in regard to its appearance and quality. It was raised by Mr. Cox, gardener to the Earl of Beauchamp at Madresfield Court, Great Malvern, some half-dozen years since, and was selected as the best of a batch of seedlings obtained from the Muscat of Alexandria and the Black Alicante intercrossed in both directions. It proves to be a Grape of excellent quality, setting its fruit as freely as the Black Hamburgh, than which it takes about a fortnight longer to ripen.

"The Vine is of a robust constitution, producing short-jointed wood, with prominent pointed eyes. The fruit-clusters are large, regularly tapered, and handsomely shouldered. The berries are large, of a longish oval shape, like those of the Muscat, perfectly black, and covered like those of the Alicante, with a fine thick bloom. They are attached by stout warted footstalks. Their skin is tough; and their flesh is firm

juicy, and rich, with a fine, luscious, muscat flavour. The leaves are briskly, deeply lobed, and serrated, with reddish stalks and midribs.

"With such qualities as those just indicated, it is not surprising that the Madresfield Court Grape should have won a first-class certificate when exhibited before the Fruit Committee in August, 1867, and that it should have been designated as a splendid new Grape. In truth it comes in as a very useful auxiliary to the few thoroughly good Grapes already in cultivation, nearly if not quite equalling the Muscat of Alexandria in quality, and indicating, by its stout firm footstalks and leathery skin, that it will rank amongst those especially useful kinds which hang well after they have reached the ripening stage."—(*Florist and Pomologist*, 3rd s., i. 265.)

PEACH CULTIVATION.—No. 6.

PRUNING (Continued).—*Figs. 5 to 8* (pages 302, 303), are representations of the training of a Peach or Nectarine tree fan fashion and for the long-pruning system, and I will now endeavour to point out the mode of proceeding.

Fig. 13 shows part of a branch having bearing shoots on the

Fig. 13.

under as well as upper side. Beyond these there are no other shoots—no spurs, no stopped shoots. It has been already shown how the bearing shoots are originated. In *fig. 13* *a* is a mature bearing shoot, which, from not being stopped, will be of considerable length, and will have fruit and wood buds terminated by a wood bud (see *fig. 9*). This, in autumn or at the winter pruning, is to be shortened to within 8 or 9 inches of its base—that is, eight joints should be left with their buds, and at the joint to which the shoot is shortened one of the buds must be a wood bud; but it is immaterial whether it have one or two blossom buds by its side or none, though it is desirable to have blossom buds as well as the wood bud. The bars across *a* and *b*, *fig. 13*, will give an idea of the pruning. All the wood buds upon the shoots *a* and *b*, or the parts left after pruning, will push shoots in spring. Those having fruit set at their base are to have their points taken out when they have made three leaves, and afterwards they should be kept closely pinched back to one joint. Those shoots having no fruit at their bases are to be rubbed off closely, but from the base of the bearing shoot a shoot must be encouraged and trained-in at its full length, as shown by the dotted lines from the bases of the bearing shoots *a* and *b*. The shoots *a* and *b*, having borne fruit, are not eligible for future bearing, and must in autumn or winter be cut off close to the origin of the successional shoots *a* and *b*. This will be more easily comprehended on reference to *c*, *fig. 13*, which represents a bearing shoot, which in the autumn after bearing is to be cut off at the bar across it close to the origin of the successional shoot *d*, which is to be cut back as already described for *a* and *b*. The following year's pruning is only a repetition of that of the preceding year, with respect to the stopping of the shoots on the bearing wood, and the originating of a shoot from the base for the next year's bearing. All bearing shoots must have a successional shoot from their base, and it cannot be kept too near the bases of the bearing shoot. Whenever there is an opportunity of securing a successional shoot from the branch it should be done, and trained-in to supplant the present bearing shoot; and the last, with its stub, should be cut away close to the branch, and the shoot from the old branch will replace it. In like manner, if a shoot push from the short stub below the bearing shoot, it should be encouraged and treated as the next bearing shoot; and the part above, at the winter pruning, should be cut back to the shoot intended for next year's bearing.

Now, one of the objections to this mode of pruning is the

shoots being allowed to grow at will. Some are very strong, others are weak; and even should they be of one uniform degree of vigour, from their great length, the buds on their upper part are in general the best, and these are the buds cut off at the winter pruning. Another objection is that the buds at the base are not so well developed, nor the shoot so strong, as in the case of a shoot stopped; for the buds, when a shoot is stopped, are better fed, and a greater majority of fruit buds is formed; and they are better in another way, for the wood becomes more fully ripened. By stopping we secure the full development of the part below the stopping, and concentrate, as it were, the vital forces of a long shoot in half the length, and that half the part needed; whereas by not stopping they are spread over twice the length, and we have a weak long shoot, buds badly developed, and wood imperfectly matured. I would advise that all successional shoots should be stopped if they exceed a greater length than 10 inches, stopping them between that and 1 foot in length, and treating them as described for the bearing wood, *fig. 12* (page 401).

Occasionally the bearing shoots do not exceed 8 or 9 inches in length. In that case they may be shortened at the winter pruning to about 6 inches, there being some bloom buds below; but if there is not a wood bud conveniently situated to which to cut back without destroying too many of the fruit buds, the shoots must be left entire, preserving the wood bud at its extremity. *Fig. 10* may be taken to represent a shoot of this kind.

A bearing shoot not having fruit setting upon it, should not be left over summer in its unfruitful state, but at the summer pruning be cut off close to the successional shoot. This will insure increased vigour of the successional shoot.

From stopping, the successional shoots sometimes push laterals lower down than is desired, or on the part which would not be cut off at the winter pruning. That is no great evil, if only their points be taken out at the first leaf, and they be stopped repeatedly, as they push, to one joint. Very often at the base of such laterals fruit buds will form; if so, at the winter pruning the laterals, if on the part to be left for bearing, may be cut back to such buds, but in no case leave more than one joint. If there are no buds, cut off close to the shoot at the winter pruning.

The training and pruning of the Peach after the tree is formed, depend on a few simple operations. 1, The bearing or intended bearing shoot is shortened at the winter pruning. 2, A shoot from the base of the bearing shoot is trained-in in summer, stopping it to secure the full development of the lower part, and its effectual ripening, a point of no mean importance in a cold climate. 3, The cutting away at the winter pruning of the shoots that have borne fruit, except the leading shoots of the branches, which, in order to remain vigorous, should not be allowed to bear fruit.

DISBUDDING AND STOPPING.—By disbudding is meant the removal of the shoots whilst in a young state. According to the directions above given, it will have been seen that no disbudding is practised for the trees trained after the first of the modes described—that is, as represented in *figs. 1 to 4* (pages 266 and 267) for we make use of all shoots from the branches, having spurs natural and artificial, and bearing-wood with its successional shoot. This, some will say, will give the tree an excessively crowded appearance; but it should not be forgotten that we have no bearing and successional shoots from the lower sides of the branches, but spurs in their place, and on the front and upper side also, when they can be obtained without crowding so as to shade and interfere with the bearing and successional shoots. If they are calculated to crowd and overlay the bearing wood, then those on the front and upper sides must be thinned; for it is necessary that they should have scope for their full development and maturation; but those on the under side cannot do any harm to the bearing and successional shoots, if the spurs be kept closely stopped, and shortened at the winter pruning; in any case, when too close together they can be thinned.

Disbudding should be governed by the weather, and consequent greater or less activity of growth. If the weather is cold vegetation is slow, and it is not desirable to disbud at that time, but when the weather is warm it should be more closely followed up. Sometimes vegetation is early, and proceeds with great activity; but if a cold period follow, the partially-developed leaves become almost stationary, and in that state disbudding ought not to be practised; for every leaf or bud in process of development promotes the circulation of the sap in its immediate neighbourhood, and to remove such, or pinch back the shoot, must to some extent cause the circulation

to cease, or find other channels. By disbudding and pinching when the weather is cold, the fluids of the tree become stagnant; but if we disbud or stop when the weather is mild, and growth active, the sap will find other channels, the circulation not being impeded or deranged. If we remove all but one shoot from a bearing shoot, or disbud and stop at the same time, it is certain that that one bud or the parts left, all being stopped, will not be able to receive and duly appropriate the sap; but if the weather is dull and vegetation advanced, we may remove all but the one shoot from the base of each bearing shoot without exciting that left to any undue development. Disbudding, therefore, should be performed by degrees. The forerights on the branches should be first removed or stopped. In a few days we may follow with shoots on the sides, and such as were not sufficiently advanced at the former disbudding, following in a few days with those on the bearing shoots, always preserving the lowest shoot on each for succession. Those with fruit at their bases, and the terminal, should be left to make three leaves, and then be pinched, and afterwards be closely pinched back to one leaf. It is a great evil to allow the shoots to become long and full-foliated before disbudding, for it causes a stagnation of the sap, and unduly excites the growth of those left; in a like manner the stopping of the shoots should be performed as soon as we have leaves nearly full-sized on the length of shoot we require. No more shoots or foliage should be left than will be fully exposed to light. In removing the shoots care should be taken not to tear off with them any portion of the bark of the shoot from which they are taken, but rub them off, or cut them off with a sharp knife.

FRUIT-THINNING.—If the trees are healthy more fruit will set than can arrive at perfection, few if any dropping unless injured by frost. The thinning of the fruit will be dependant on the vigour of the tree and size of the fruit; on a weak tree the fruit should be left considerably thinner than those on trees that are vigorous, whilst the thinning on the individual tree must not be the same throughout. Some parts of the tree will be weak in comparison to others; on the weak parts the fruit must be left thin; on the vigorous portions the fruit must be left more thickly. The small-fruited sorts should have the fruit left more thickly than the large-fruited. A vigorous tree of the large-fruited kinds, as the *Grosse Mignonne*, *Barrington*, &c., may be allowed one fruit for every foot of surface covered by the tree, but it is not necessary that the fruit should be distributed evenly over the tree, for some parts are weak, and there the fruit must be left thin, vigorous parts having more left than would be the case were the weak and vigorous parts allowed to bear equally. It will be sufficient if no more fruit be left than the tree can properly mature, and every healthy tree will bring to perfection a fruit to every foot of wall covered. Such varieties as the *Royal George* will perfect three fruit to every 2 feet of wall covered, and *Nectarines* will bear to have the fruit left more thickly than *Peaches* of the large-fruited sorts. Large kinds of *Nectarines* may be thinned to three for every 2 feet of wall covered, whilst for the small kinds two fruit per foot may be left.

In calculating the extent of wall covered, it should be calculated from the extent of the branches at the bottom of the wall and the height, without taking into account the current year's growth; and the dimensions taken in feet, multiplied together, will give the number of square feet, and it is then easy to thin so as to leave the proper number of fruit on each tree.

It is a common error to allow too many fruit to remain, indeed, some trees are permitted to bear as many as they will, the result being the weakening of the trees; for, though the number may be great, the fruit, if weighed, will not afford such a weight of flesh as if it had been properly thinned. The weakening of the tree is dependant more on the number of the fruit than on their size, for it is the production of stones or seed that diminishes the vigour of the tree, and to take twice the number of fruits that ought to be left, is to reduce its vigour correspondingly; besides, the fruits are small, thin in flesh, and badly coloured, indeed, only fit for those unaccustomed to eat the *Peach* or *Nectarine* when full-sized and perfectly ripened.

The first thinning should take place when the young fruit is about the size of a hazel nut, but rather under than over that size. It will be seen by that time which, if any, fruits have been injured by spring frosts. There will be different sizes. The smallest will, of course, be removed, for these in most cases would not form stones, and in that event they must fall, from the kernel being injured by frost or some other cause. If the fruits are almost of one size they may be nearly thinned at

once, though it is well to leave a greater number at the first thinning than are required, until such time as the fruit is stoned, and then reduce them to the proper number. In taking off the green fruits care should be exercised so as not to remove or damage the bark of the shoots. The fruit should be gently twisted round and pressed upwards, for if pulled backwards or downwards in the direction of the base of the shoot it is likely the fruit will bring away with it a portion of the bark. To prevent the tearing of the bark, the fruit may be clipped off, the only purpose for which the scissors should be employed about a *Peach* tree.—G. ARLEY.

WORK FOR THE WEEK.

KITCHEN GARDEN.

WHEEL dung on vacant ground, renew old decayed borders, and procure good fresh loam to form new ones. Clean old shreds not too much wasted for use, by boiling them, and cut plenty of fresh ones. Deprive nails that have been used, of the adhering mortar, &c., by heating them red hot in an iron vessel, and to prevent their rusting immerse them in oil before they cool. All the more tender vegetables, such as *Cauliflowers*, *Lettuce*, &c., previously secured, will be found of great service during the winter. Rooms or sheds with thick walls, and lathed and plastered, so as to be cold in summer and warm in winter, or cellars or underground rooms, will be of great advantage, as then a supply may be maintained with comparatively little trouble during either severe weather in winter, or for a month or two of dry scorching weather in summer. The north side of a wall, with material to keep out the wet, and leaves or straw to exclude frost, may also be used with advantage. Secure *Potatoes* from frost; examine *Onions*, removing every one that has the smallest speck. Keep a supply of *Turnips*, *Celery*, *Jerusalem Artichokes*, *Horseradish*, &c., in case of a severe frost. Keep up a supply of *Herbs*, such as *Tarragon* and *Mint*, by placing roots either in pots or in *Asparagus* frames at work. The same method may be adopted with *Parsley* and *Chervil*, if you are likely to be short. Fill pots or boxes with *Rhubarb*, *Sea-kale*, and *Chicory*, to be placed in the *Mashroom* house, or in any corner where heat and darkness can be secured.

FRUIT GARDEN.

When planting fruit trees, if only an improvement in the soil is thought necessary, loam and leaf mould are the best materials for the purpose, and as a makeshift for drainage, raise as much as possible the spots where the trees are to be planted. In transplanting, the trees should be taken up with great care, and broken, bruised, or straggling roots pruned with a clean cut. When planting, spread the roots out equally in a hole of moderate depth, and of more than sufficient width for the extent of the roots; the fresh soil to be shaken carefully over them, and gently pressed down, not stamped with the feet, all round; then water and mulch, and train to the wall or espalier, or firmly stake if the tree is a standard. Fig trees should be protected from frost by unmailing the branches, and tying them in bundles, each bundle to be thickly covered with hay ropes, and tied up to large nails firmly fixed in the wall; or, extend the branches on the ground at the foot of the wall, and cover them with litter. If old *Gooseberry* and *Currant*, or standard *Apple* and *Pear* trees are infested with moss, a good dredging of powdered quicklime put on when the bark is moist will entirely destroy it, and render the stems and bark clean and healthy. If the root-pruning of fruit trees is considered necessary to check over-luxuriance, it should be attended to without further delay. Anoint all trees and bushes that are pruned, with a mixture of equal parts of cowdung, clay, soot, and lime, brought to the consistence of paint with strong soapsuds, urine, or the rich drainings of the dunghill.

FLOWER GARDEN.

This has been a very favourable season for the blooming of out-door *Chrysanthemums*, and I do not recollect to have ever before seen them in such fine condition, or to so much advantage. For the autumn decoration of the flower garden, especially in country places, they are certainly deserving of more attention than has hitherto been bestowed on them. If there is any tree, shrub, or plant, that the experience of past seasons has proved to be susceptible of injury from frosts, or the inclemency of the winter weather, it should be protected in good time. *Laurustinus*, *Variegated Hollies*, or similar shrubs, which have not grown kindly, ought to be supplied with a top-dressing of rotten dung or leaf mould, to be placed over the

roots, and lightly forked into the ground. If a similar want of luxuriance is perceptible in Rhododendrons, and other evergreen American shrubs, they may be taken up and replanted with advantage, enriching the ground at the same time with a liberal supply of peat soil, or well-decomposed leaf mould. Hoeing and raking the borders amongst shrubs will be sufficient to give a neat and clean appearance, without employing the spade, which is very objectionable, when by its use the fibrous roots of shrubs are cut.

GREENHOUSE AND CONSERVATORY.

The best temperature for the conservatory in cold weather is about 45°, although the generality of half-hardy plants will outlive the winter if the frost is kept from them, but the temperature of 45° is high enough for a conservatory not attached to sitting-rooms, and only used for the purpose of wintering large specimens, and not containing plants in bloom. A few good stove plants, and a forcing pit, are essential towards keeping up a good appearance in the conservatory in winter. See that the fireplaces, flues, and pipes act properly, as we often hear of accidents arising from such sources. Where the heating apparatus is barely sufficient to keep up the required temperature, accidents are more likely to follow. Sometimes plants are injured at this time by being placed over the parts of the pavement beneath which the pipes pass; in such cases an empty pot under that in which the plant is growing, would lessen the risk of the roots being dried too much. Another source of great injury to the plants in the borders, is their roots coming in contact with the walls which divide the beds from the hot-water pipes, when these are so arranged. Keeping such parts well moistened partly prevents injury, but in cases of this sort the beds or borders ought to be protected by a few inches of some non-conducting material, as by sawdust or pounded charcoal cased with a brick-on-edge wall between it and the soil. This arrangement ought never to be omitted where the pipes run under the paths, &c. The best way of forming a stock of pot climbers for exhibition in the shortest time, is to plant young plants of them in the borders; for a year or two encourage them to grow as much as possible, and then take them up for potting.

STOVE.

It is now fully acknowledged on all hands, that a high temperature in winter is injurious to stove plants, and it is no less injurious to have the atmosphere too moist, with a low temperature at night; hence the practice of watering early in the day. If there is any stove climber or shrub planted out in a bed or border, which it is desirable to move to another situation to flower next year, this is the best time to begin to prepare such plants for the change. Dig round one side, and take up half of the roots, place them near the surface, and fill in about them with sand, peat, and leaf mould, give a gentle watering, and in six weeks the new roots will be formed, to feed the plant; then the other half of the roots may be taken up and treated in the same way, and on any rainy day in March or April, the plant may be potted or transplanted without injury. Climbers 50 feet long and branched in all directions, have been removed in this way without their growth being diminished in the following season, and the experiment will succeed with Passion-flowers, Beaumontias, Allamandas, Echites, &c.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

Digging, Trenching, and Ridging Ground.—Where there is vacant ground, and of that we have as yet little, there could be no better weather for turning it over by adopting one or other of the above modes, of which something like the rationale was given the other week. It is always important to dig-down soil after it has been frozen when fully thawed, and it is equally important to turn it again, for at least part of its depth, when so slightly frosted as to admit of that being done, and when a keener frost is expected. The more all rather stiff ground is turned so that the frosty air has direct access to the soil, the sweeter will this become, and the better pulverised will it be. We cannot depend on the season, or, as a matter of choice, we would prefer that vacant ground at all stiff, and where slugs, &c., had been troublesome, should be well frosted before being broken-up, then turned up as soon as the spade would go in, and exposed in the rough to future frosts by frequent turnings in a rough way. We have thus got rid of the slugs and snails for a season or two; but, when trenching or ridging

before the surface was frozen for several inches in depth, we have found the slimy tribe as numerous and destructive after a severe winter as after a mild one.

It is well now to fix on all the ground intended for long, tuberous-root crops, as Carrots, Parsnips, &c. The great point in their case is to have what manure is given placed in the bottom of the trench, and after the first trenching and ridging, whatever turnings the ground may have, the spade should not go so deep as to bring up or incorporate the manure with the bulk of the soil. That from the bottom of the trench will make excellent material for mere surface-rooting vegetables in the following season.

There is a great inequality in the country as to the power of the gardener to do his soil and his crops justice. We go into one place where the empty quarters—the fallowing system—can be carried out to such an extent that the gardener has actually to think what he can fill the garden with, so as at one time of the year to show it all well cropped; and we go into another garden, where except the places from which Carrots and Parsnips were taken late, there is scarcely an empty piece of ground to be seen, even in winter, to say nothing of the frequent crops in summer.

Such constant work can only be done by carefully stirring the ground, and the addition of some decomposing organised material for sustaining continued fertility. A garden much too large is a continued annoyance, but one too small is often a continued loss. The best compromise in the latter case is to grow a portion of the commoner vegetables, as Potatoes, Carrots, Turnips, &c., in a field, and that a fresh piece every few years, so as to afford all the benefit of fresh soil and rotation of cropping. It is one of those strange things for which there is no accounting, that gentlemen who are satisfied with but moderate returns from their fields after dunging them well, tilling them well, and fallowing, as well as putting them under the restorative process of green crops, cannot see that a kitchen garden will be worn out after such continuous cropping, and that even dung will come to be a bane rather than a blessing, if not brought into a more soluble and sweet condition by liming or exposure. In old, dark-coloured garden soil we have known from sixty to seventy bushels of lime per acre produce as wonderful an effect as it frequently does on fresh-reclaimed peaty soil. The time will come, when if we have fine walled gardens, and we ourselves never wish to see them gone, the new ones will enclose much less space than we now find in large establishments, and then the bulk of vegetables will be grown in fields, and be sweeter and finer than they can be obtained from old gardens, change and rotate the crops as you may. In the quality of vegetables, do what we can, we can never beat the market gardeners, and what contributes mostly to the quality is the more open and free exposure, for most of them give the ground little rest, though they are adepts in manning and changing their crops. Many small gardens that would grow fruit well, and the earlier and later vegetables, are spoiled because too much is attempted in them, and expected from them. It is perfectly wonderful what is thus collected from perhaps less than an acre of garden ground, and yet the owner of that garden will be satisfied if he receive from 25s. to 30s. an acre for the contiguous land.

The chief point to be attended to in the rotation of crops is to have deep-rooting and shallow-rooting crops following each other, and the same may be said of fibrous-rooting and tuberous-rooting crops. The tuberous roots do best in rather poor soil. Celery is a good preparation for most crops, except the tuberous-rooted, as the dung when spread out from the trenches makes the bulk of the soil too rich, and encourages surface-rooting, and the dividing or branching of the tuber. Celery ground, after being trenched, and the well-sweetened dung left divided over the ground, does admirably for Peas, Beans, Cauliflowers, Cabbage, &c., and first-rate for Onions, with, perhaps, a little more sweet manure added. Cabbage is a good follower of the Onion quarter or bed, but nothing could be worse than to have Onions following Cabbage. In fact, every time we tried it, even after manuring, we had reason to regret it. In our case, however, the Cabbages had a long lease of the ground, planted say in September, and producing heavily all the following summer, and if the second winter was at all favourable, up to the second March from planting. We admire the Coleworts that come in for use from October, but we have had a fine bed of Coleworts destroyed in midwinter, when the old stalks of the old Cabbages carried us through with abundance of nice sweet sprouts; so that in general our main plantation of Cabbages stands through two winters.

Sea-kale and Rhubarb.—Put in some more Sea-kale into the Mushroom house, having gathered a lot very good for the season, so that the buds will be sooner ripened. We think of having a short row specially for taking up early, as the bulk of our crop is in a shady place where it does well for general purposes. We suspect that the position renders the ripening of the buds and roots later than it otherwise would be. At any rate, for two or three seasons our first Rhubarb from plants taken up has not pleased us; in fact, the second lot often comes in good as soon as, and even before the first. Most likely we have hinted at the reason—at least it seems to us we can hardly expect better success until we change our treatment, but the subject is worth the attention of many of our correspondents. Even now we have no difficulty, except with the first lot, and we see no reason, if the Rhubarb plants are early ripened so as to have a rest, why they should not yield as good gatherings in November as Sea-kale or Asparagus. As to the latter, we will not do much, as we rather overdid our stock last year, and the dry summer and no water at our command prevented our young crops progressing as usual.

Mushrooms.—Our beds in the shed are still producing, and we have spawned the fourth piece in the Mushroom house, the fourth piece bearing well, and the second beginning to show. We have only two shelves in the house, one on each side of a pathway, and these we divide into four or more pieces. The house being a lean-to, facing the north, we would have more shelves, but for the lifting-up the material in baskets, &c. We have on the floor a space equal in width to these shelves; there we also make some beds, but we are generally more troubled with woodlice, slugs, &c., on these low beds than on the shallow shelves.

What we introduce the Mushroom house now chiefly for, is to state that the top ventilation for this house is merely an air-brick at the apex at each end, and in such close weather as this, such a small amount of ventilation is not sufficient, especially when every now and then you have to take in fresh material for fresh beds. Even though we put a little dry hay on the bearing bed, to bring it on more quickly for a definite purpose, the hay soon became damp, from condensed moisture, as none will rest on the roof. But for the sake of appearance, this does little harm, but those who eat the Mushrooms might not like to see them coming out from amongst such a damp covering. Sometimes after making a fresh bed we have placed a mat or a cloth over a bearing bed to keep out this condensed moisture. Were we building a house on purpose again, we would have a cowed air-shaft in every 25 or 30-feet length of roof, fixing it near the apex or ridge board. We can give air in the front wall, but in such weather as this, without using fire heat, this would do little to mitigate the evil, and though it may be a prejudice of ours, it is not held without many practical results to confirm it, that keen draughts are not relished by Mushrooms when artificially cultivated. We would even have open gauze to cover the openings in the air-shaft. Unless for a short time, and in such damp weather as we have lately had, our two metal ventilators the size of a brick, one at each end, are enough for what ventilation is needed, as the Mushroom likes a close, moist atmosphere.

Roof of the Mushroom House.—This reminds us of our neglect last week in not attending to the request of "one of our oldest readers," who "hates the idea of having a thatched roof, but whose slate roof is exceptionally hot in summer, and cold in winter, and that it only lasts a few years before it wants renewal, as the damp gets at the lath and rafters, and rots them in a short time. How proceed with his fresh roof?" Thus: have rafters or bearers of the usual size, have thin boards close over the bearers beneath the slates. Before fastening these boards nail on double lath for the plaster, stuff the space between the lath and boards with dry straw before nailing the boards down and slating, plaster inside twice in the usual way. When dry run a little cement all round where the plaster joins the wall, and, as above stated, when the plaster is dry enough, paint all over the plastered roof with boiled linseed oil. This will prevent damp finding its way to lath or rafters, and if the

slates are whitewashed with new lime in a hot dry day, that and the straw and wood together, will keep the roof at something like an equable temperature. In this case we have practised with profit what we advise.

Leaves and Dung for Hotbeds.—From the many inquiries that have come to us lately, two things are certain—first, that great numbers of our readers are convinced of the importance of a little bottom heat for many purposes, as helping late cuttings, bringing on bulbs after the pots are full of roots, enticing newly-potted plants to root, whilst the heads of the plants are kept cool; bringing on Sea-kale, Asparagus, Rhubarb, helping Strawberries in pots, and raising young plants of Cucumbers, &c. In the second place, however, there seem to be more difficulties in the making and management of a hotbed than was humorously described by "MAUD" some time ago. These difficulties and drawbacks refer chiefly to cases where there is little manure to be had, and there is a wish to make the most of it for heating, as it can all be used, when decomposed, for the garden. We recollect entering very fully into this subject last year, and showing how much of the difficulty would be surmounted by working and lessening the bulk of the dung but little beforehand, thus saving labour, time, and material. When such crops as Cucumbers are contemplated early, it is good, where manure is scarce, to have a one-light box for raising the plants in, and whilst that is going on the manure can be preparing. "DELTA" says "He has nothing but stable dung, can calculate on a barrowload per day, and wants a sweet, safe hotbed, with as little trouble as possible." In such a case have a fortnight's manure laid out rather thinly, so as not to heat. Lay out another week's manure separately, and then shake up the first fortnight's into a heap, watering when dry, and covering with long litter. In about eight or ten days turn this heap again, placing the top at the bottom, the outside at the centre, and the centre at the outside, and in about a week more it will be sweet enough for use. The second fortnight's dung should also be thrown into a heap, but not turned. The fifth week's dung we would place at once for the bottom of the bed, build the second fortnight's on it, and then the first-prepared dung on that. With a coating of ashes, &c., seeds may be sown at once. It would be well to delay a few days before placing plants in the frame; but one of the best tests as to safety is closely to observe the condensed moisture on the bars and glass of the frame. If these drops are brown or yellowish in colour, trust nothing growing in the frame. If they are clear as dewdrops, trust anything and everything that heat will not injure. If you could surface with from 6 to 9 inches of three-parts rotten dung from the centre of an old bed, we would be satisfied with still less preparation of the dung intended for the surface, but without that the once turning at least will be necessary.

We stated lately that the heat produced from tree leaves can be safely used for any purpose, as it is sweet at once. Hence the advantage which "ETA" possesses, who has rather more dung than "DELTA," and who, from pleasure grounds and other sources, can have several loads of tree leaves. In such a case we would prepare a part of the dung but little, and the most of it less, and cover with a foot of the sweet tree leaves. The sweet covering to keep down all rankness is the great essential, and that secured, it is more economical in every way that the dung should give out its heat as it decomposes slowly in the bed, rather than waste its bulk and its heat by being kept long in a fermenting heap. Of course, we would not for a moment urge such a plan on our great gardeners, who can go to their mounds of fermenting material; we merely wish to simplify all the difficulties of hotbed-making to those who have little material, and to impress on them the simple fact, that from 8 inches to a foot of sweet surfacing will keep down all noxious steam. Treated in a more rough manner than we have described, Cucumber beds made in February continued in good bearing until the middle of October, without even a living being turned; but then the beds were made large at once.

FRUIT GARDEN.

Before frost comes, in addition to mulching Strawberries, it would be advisable to stick some evergreen boughs among British Queen, and the tender sorts. It is still fine weather for planting fruit and other trees. Where birds abound, and are destructive to buds, we have found no plan better for bushes of Gooseberries and Currants, than to tie them up like a faggot, or as nearly like one as that can be done without injuring the bushes, and then syringe them with limewash, using an old syringe for the purpose. No better weather could be

had for pruning. We have been so annoyed with birds, that such as Gooseberry trees we avoid pruning as long as we can.

ORNAMENTAL DEPARTMENT.

Here we have been very busy, altering, and making changes, but most of the work has been referred to, especially planting for cover and for permanent trees, re-arranging the rosery, &c., and but for the lists given by Mr. Radclyffe and others we might have had something to say on that subject.—R. F.

COVENT GARDEN MARKET.—DECEMBER 9.

WE have again received a supply of well-grown Pines from St. Michael's, also a large supply of home-grown for this period of the year. Oranges are abundant, and the market stands show plenty of vegetables of excellent quality. Pears and Apples more than sufficient for the demand.

FRUIT.

TRADE CATALOGUE RECEIVED.

John Standish & Co., Royal Nursery, Ascot, Berks.—*Catalogue of New and Rare Plants, Hardy Trees, Shrubs, Coniferae, American Plants, &c.* With six coloured Plates.

TO CORRESPONDENTS.

BOOKS (J. R. M.).—We know of no books on emigrating to New Zealand. (F. V. M.).—Keane's "In-door Gardening," 1s. 6d.; "Out-door Gardening," 1s. 6d.; the "Garden Manual," 1s. 6d.; the "Vine Manual," 2s. 6d. You can have them all free by post from our office if you enclose the amount in postage stamps with your address, and eight stamps for postage.

MANURE FOR ROSES (G. H. M.).—"I do not use charcoal. If you would prevent mildew you must give the pot Roses air and syringings. From want of these, Roses and other plants under glass suffer from mildew. I should think that charcoal would not stop mildew. After Roses have produced their first series of bloom under glass, they should be moved out into the air to ripen their bark and wood. Fresh pot your Roses, using turfy loam. You cannot refresh them in pots with better stuff than gusno water.—W. F. RADCLYFFE."

COVERS FOR FACE VOLUMES (E. M.).—You can have covers for a year's numbers of this Journal, but each only for six months. If you state your address, mention what year you require the covers for, and enclose thirty postage stamps, the covers will be sent to you postage paid from this office.

STORING TURNIPS (O. C.).—To keep them from being frosted pull them up, cut off the leaves and tap roots close to the bulbs, pile these in a heap, and cover them 9 inches deep with earth, smoothing the outside with the back of the spade.

ROSES (F. G.).—With the exception of *Aspasie*, Hybrid *Perpetual*, the varieties you name are summer Roses. *Comtesse de La Roche* is good; the other two are useful, but superseded by better kinds. We know of no work specially treating of the propagation of trees and shrubs. It is against our rule to recommend one dealer in preference to another.

DRAINAGE FROM COW HOUSE (T.).—Powdered charcoal might deodorise it. The drainage does not require dunting if applied to vacant ground, and dug in for culinary crops. If applied to dormant flower-garden plants, two bucketsful of water to one of drainage would be a safe proportion; if to growing plants, five of water to one of drainage.

FOWLS' DUNG (J. J.).—It is one of the most fertilising of manures. Do not turn it over, but keep it under cover until required. Trench your ground for the Carrots and Parsnips, and dig in about an inch in depth with the bottom spit. Dig in about the same quantity with the surface spit for Turnips and other vegetables.

PROPAGATING BRIAR STOCKS FOR ROSES (A Subscriber).—Rose stocks when raised from seed are not so desirable as those propagated by cuttings, as they are always apt to produce suckers plentifully; but with cuttings this is not the case, for the buds or eyes are taken out before the cuttings are inserted in the ground, throughout the length of the part that is to go into the soil. Instead of raising Briar stocks from seed, it is more economical to purchase them; they can be obtained with stems 4 feet or more high at a small sum per hundred. If seed be sown, three or four years at least must elapse before the plants would be fit for budding—that is, if they are intended for standards, whilst for dwarfs they might be worked in the second or third year. You may gather the heps of the Briar now, keep them in sand till the beginning of March, pull them in pieces, and sow an inch apart in drills about 6 inches from each other. The drills should be from three quarters of an inch to 1 inch deep, and the seeds should be covered with that depth of fine soil. The soil should be light and rich. Care should be taken to protect them from mice, which are very fond of the seed. It is likely you will have few if any plants the first year, as the seed generally does not germinate the first year. Keep the ground clear of weeds, and in the autumn of the second year take up the plants and plant out in good rich soil in lines 1 foot apart, and 6 inches from plant to plant in the row.

POTTING SEEDLING PELARGONIUMS (J. M.).—You do not say when the seed was sown, nor what size the plants are. If sown early this year, and in good health, you may bloom them very well in 6-inch pots, which are what we recommend; but for small plants from seed sown in August, or since then, that size of pot will not be required until they have been stopped and have become good bushy plants, say in April. A good compost is formed of two-thirds turfy loam, and one-third leaf mould, with a free admixture of silver sand. Mildew on Pelargoniums may be kept under by dusting the plants with flowers of sulphur where affected. This will not only destroy the mildew, but act as a preventive. Give more air—indeed, they should have fresh air every day, if only for an hour; keep cool and near the glass, and give no more water than is necessary to prevent the leaves flagging.

THRIPS ON CINERARIAS (*An Inquirer*).—The leaves were severely attacked by thrips, which is the small long insect you notice. Dusting with flowers of sulphur will not do any good unless the leaves are mildewed. The only remedy is to fumigate on a calm evening, taking care to have the foliage of the plants dry. Shut the house up closely, and fill it with smoke so that a plant cannot be seen from the outside. Repeat the fumigation whenever an insect of this kind is seen.

PROTECTING WELLINGTONIA GIGANTEA AND CUPRESSUS MACROCARPA (L. M. E.).—Both are hardy and do not require protection; but if the situation is very bleak and exposed you may drive some stakes into the ground, and hang up mats so as to shelter the trees from cold violent winds; but such protection should only be employed in very severe periods and until the plants become established.

VENTILATING GREENHOUSES AND FRAMES (*Idem*).—Damp mild weather is the time of all others when ventilation should be most carefully attended to. You cannot ventilate a greenhouse too much if you keep out rain and do not lower the temperature below 40°. Cold frames should have air every day when the temperature of the external atmosphere is 40°; but the lights ought not to be taken off during wet weather; they should then be merely tilted, so as to admit air and yet keep the plants dry. Nothing is so injurious in wintering plants as allowing them to become soaked with wet.

PRUNING RASPBERRIES (M. P.).—When the canes are more than 4 feet long shorten them to that height, which is quite long enough, and when of less height than that we like to cut off the small parts or ends of the canes, cutting back to some good eyes, as from the most plump eyes and strongest wood the finest largest fruit is produced. When the canes are very strong they may be shortened to 5 feet. The shortening or cutting-back should not be done until the end of February or beginning of March, as when it is done before winter the canes are liable to suffer from frost if it should prove severe.

PLANTING CLUMPS OF FOREST TREES (G. A. B.).—It would be difficult to say what would be the best form for the clumps; but for such small clumps as those you name we would have the Beech in a circle, and make it the centre clump, placing the Oak and Chestnut in separate clumps at the side of the Beech, and not in a straight line, but dotted irregularly. These we would plant in ovals. We would plant 4 feet from the margin, and allow 8 feet from plant to plant, placing a shrub between each. Common and Portugal Laurel, Yew, Aucuba, tree Box, and Laurustinus are good plants for planting along with trees to form undergrowth. If you do not plant shrubs, the Oaks, Beech, and Chestnut should be planted 4 feet apart.

WIRE FOR PEACH TREES, &c. (W. Osborne).—Addressed to "TRY," we answered your queries at page 411.

OUT-OF-DOORS VINES (*Grapes*).—Plant without delay; it is full late, unless the Vines are in pots, and can then be turned out and planted in the border at any time. Apply to the nurserymen in your neighbourhood—they all have the Royal Marcadine and Black Hamburgh. The latter ripens well against an open wall at Winchester.

TRAINING VINES (*Reader*).—Your success in growing Vines first vertically and then angularly across the roof, will depend on having the Vines trained so thinly that the sun will reach the base of the vertical part. Some time ago we described a span-roofed house of Mr. Hawkins's near Hitchin, where the Vines were planted in the centre of the house and bent right down to the ground; but though Vines went along the roof, top and bottom, there was a clear open space in the roof for the benefit of the vertical part. We would do-bud as soon as we could select the fruiting spurs, and with the general proposed management we thoroughly agree.

PLANTING OUT VINES FROM POTS (R. H. C.).—If the Vines have fruited at all heavily in pots, they will do little good when planted out in a vinery. They would have a good chance if you shook the earth from their roots, repotted them, cut them down to a bud or two, and grew them in pots until midsummer, and then planted them out, or even deferred the planting until next season. We would far prefer a Vine that has not fruited to one that has done so in a pot.

FLOWER BEDS PLANTING (W.).—Your plan is simple, and the proposed planting is simple and will look well. For the first eight beds from the centre we would pair in similar shades of scarlet Pelargoniums, and ring

these pairs alternately with purple Verbena and white or variegated-leaved Pelargoniums. Hinnas would look well in your outside circles. Other beds as you propose, but a few good Pelargoniums, &c., might go in the centre of the long beds.

VINE AND FIG TREE PRUNING (T. J. Mason).—We can hardly tell you how to prune your Vines without knowing more about them. If on the spur system the side shoots may be cut back to one or two buds, and the leader to 18 inches or 2 feet; and as the leaves have fallen the pruning cannot be done too soon. Your Fig tree with five branches 18 inches long we would not prune at all, but as soon as growth commences cut the terminal bud of each shoot in two, and that will cause the fruit, if there is fruit, to set better, and you will afterwards have plenty of young shoots to choose from.

SOLANUM CAPSICARUM (Idem).—It requires more heat than a common greenhouse—say average of 50° to 55°. The low temperature is against it.

GREENHOUSE FAILURES (Ignoramus).—We never before heard of a new house that seemed to ruin everything that went into it! We have no doubt that either the glass is very bad, or the ventilation is very deficient. Examine the glass for scars, and if you find any dab them with paint, and that will stop burning. We should care nothing for a blaze of light if the glass were good. If the sun is rather strong it is easy to dull the glass a little with size water. The practice with this one house may not be quite right. The syringing such plants, and especially Pelargoniums, is almost sure to cause spot and decay.

EARLIEST CUCUMBER (A Young Beginner).—The earliest and best Cucumber for winter is the Lord Kenyon or Lion House Improved, a smooth-skinned one, growing from 8 to 12 inches long. Among smooth white-spined Cucumbers, Volunteer is good, and ranges from 8 to 18 inches. Telegraph is a little longer, but requires more heat than the above two. Catbill's Black Spine is also a good Cucumber, averaging about a foot in length, but will not come so soon as the above. Mr. Cox, of Kimpton Hoe, used to do wonders with the Volunteer. We have seen from three to five Cucumbers at a joint.

GISBURST COMPOUND (E. A. S.).—After this is dissolved in water exposure to the air does not destroy its effectiveness or weaken it, if not kept exposed for a long time. The dissolving first is useful when you syringe trees in leaf, otherwise not.

TREES IN POTS (Dougal McDougall).—Do not put into the pots more than from 1 to 1½ inch of drainage, but sprinkle some moss over it and a little soil; but then we like to water moderately, and have always been rather scarce of water. In placing the pots partly in the ground, we allow the bottom of the pot to rest on the soil. The plan you propose of allowing the bottom of the pot to rest on two bricks, with an open space for free drainage between them, is good; but we have found no use for it, as the water in all our pots passes quite fast enough away, and we rather like the roots to run a little out during the summer. In two years we have hardly had two pots waterlogged, and these we lifted, and picked the hard soil from the hole in the bottom of the pot, and that made all right. One of our objections to plunging pots in sawdust is, that after a time the sawdust clogs up the drainage hole completely. If you have plenty of water we have no objection to your proposed plan, but we do not find any stagnation of water without it.

MULCHING—LOAM DEFINED (Idem).—Mulching is the placing rotten dung and rich soil over the surface of the pot as the soil sinks and you wish to give more strength. You will soon be surprised where the mulching goes. The mulching and the fresh surfacing is the secret of keeping trees in pots bearing for years without fresh potting. A good loamy soil is one that is neither too sandy nor too clayey—one that when moderately moist will squeeze tight in your hand and retain the traces of your fingers, and yet when dryish will crumble into pieces. If very sandy it will not be cohesive enough. If there is too much clay it will be too close. If at all in doubt ask a neighbouring gardener to look at some kinds of loam for you. Sandy loam, such as you will find at most roadsides, is the best for plants. Turfy loam is loam taken from the green sward of a pasture, or the sides of roads and lanes, taken off thin—from 1 to 2 or 3 inches in thickness, and allowed to decompose for a few months after being piled in a heap. When broken up for use such loam will be found full of decayed vegetable fibre, and hence its use for nourishment and keeping the staple open. When we advised covering your trees in summer and winter with a net we meant common fish-net, and the only use of the net is for keeping birds from the buds and fruit. The frog dome, to which you allude, is for protection against frost. Of course, if you can manage the birds you will not need the netting.

GLASS ENCLOSURE FOR VINE (C. R.).—The frame is after the fashion of the cylinderinery invented by Dr. Newington, but unlike that in the glass not touching the ground. The permanent cap will make the frame ainery, and then the Vine will require syringing and water; whereas, if the cap is removed as soon as danger from spring frosts is over, say the first week in June, the Grapes will ripen well without further care. The Canary and the Exquisite Peaches, like nearly all the yellow-fleshed Peaches, require a hot summer like the last, otherwise their flavour is flat and insipid as a rule; except to ornament the dessert they are not fit for general cultivation. When crossed with our green-fleshed Peaches they produce seedlings not so high in colour, but of a superior and more vinous flavour.

AZALEAS LOSING THEIR LEAVES (St. Dennis).—It is usual for Azaleas to lose their old leaves at this season, but we cannot explain the cause of the fresh leaves withering. Why syringe the plants overhead at this season? and why have the temperature 45° or 50° at night, and 60° or 65° by day? We can only account for the leaves withering from their being injured, it may be by an escape of smoke from a fire, fumes from sulphur becoming ignited, or over-fumigation with tobacco or something prejudicial to plants. Neglecting to give water would cause the leaves to fall, and the young foliage may also wither from its being attacked by thrips. We cannot, however, from description assign any positive cause for the leaves falling and withering. The temperature for Azaleas and Camellias at this time of year should be 40° at night from fire heat, and 45° by day. There will be times when this temperature, from sun heat, will be exceeded, but this is an advantage, as it affords an opportunity for giving air, and when the temperature from natural heat is sufficient to maintain the temperature fire heat should be dispensed with. The Camellia buds will in a great measure fall. The cause is imperfect root action resulting from improper soil, imperfect drainage, or the want of water at an earlier period.

REPOTTING AZALEAS AND CAMELLIAS (Subscriber).—You do not say whether your plants are small or large. If large they will not require to be potted oftener than every other year, but if young growing plants and vigorous they should be potted every year. The best signs of a plant requiring repotting are its filling the pot with roots, and soon becoming dry after watering, or often requiring water. The best compost for the Camellia is turf taken about an inch thick, not more, from a pasture where the soil is a good, rich, sandy loam. This should be used fresh, tearing it in rather small pieces with the hand, and in pottling make it firm, finishing off with a little fine soil. Failing that, a compost of two parts sandy fibrous peat, and one part fibrous loam, with a free admixture of silver sand, answers very well both for Camellias and Azaleas, adding, if it can be obtained, a sixth part of old dry cow dung. Good drainage must be provided.

COMPOST FOR VARIEGATED PELARGONIUMS (Idem).—Two parts loam from rotted turves, and one part old dry cow dung, or well-rotted manure, will grow them well, adding sand liberally. The plants, if for the summer and autumn decoration of the greenhouse, should be potted in March, and in May or June; young plants being frequently repotted from time to time as the pots become filled with roots.

PROTECTING RANUNCULUSES (An Amateur).—The Turban Ranunculuses will not sustain any harm now that they have top-dressed them with short manure, only we think you have put it on too thickly. An inch in thickness would have been sufficient, and we should have preferred it had it not been very rotten. We think leaves about three parts decomposed a better mulching than rotten manure. In very severe weather you may place a thin covering of dry fern or short dry litter over the beds, taking care to remove it when the frost is past. Double Anemones planted at the same time as the Ranunculuses may have a top-dressing of leaf mould or short manure, which will be all the protection they will need. The Ranunculuses were not planted too soon. You will have a better bloom by early than late planting.

FLOWERING BOUGAINVILLEA LATERRIA AT THE END OF JUNE (S. M.).—We presume your plant is well ripened and has made a good growth during the past year. It will, therefore, need to be started into growth early in February, and forwarded in a brick heat, securing a good growth, and at the end of April place it in the full sun, keeping dry and in this state for about six weeks, then by placing it in heat again it may probably flower at the time you wish, but everything is dependant on the present condition of the plant.

GROWING CYCLAMEN PERSICUM IN A COLD PIT (Thorn).—The Cyclamens will do well in the pit as you propose, it is a move in the right direction. We would not remove any of the present soil, but add to leaf mould, peat, turfy loam, and rotten cow dung in equal parts, a top-dressing 6 inches thick, and work it into the soil, stirring it to the depth of 15 inches. If the soil is of a close nature, add 3 inches in thickness of freestone, or grit, in pieces from the size of a pea up to that of a walnut, mixing it well with the soil. About 3 inches of fine soil may be placed over the bed for planting in, the combs being placed with their crowns about an inch below the surface. The surface of the soil should not be more than 6 inches from the glass for seedlings, and for established plants 9 inches. The best means of protecting will be a covering of mats, and in very severe weather an extra covering of straw will be required. The lamp will not answer well.

PACKING TREE FERNS (Wiltshire Curate).—Tree Ferns may safely be brought to this country, if taken up and packed in dry material, as straw or hay.

GRAFTING A VINE FOR FRUITING THE SAME SEASON (Somerset).—It is practicable to graft a Vine with a scion having eight or nine eyes instead of two, but the eyes will break very irregularly, and the fruit, if any be allowed to grow, will set very badly; besides you will have a weak growth and a poor prospect for another year. We would only leave two good eyes, and encourage one, so as to secure a good, strong, well-ripened cane.

OLEANDER CULTURE (Germanicus).—The plant should be repotted in spring, employing a compost of two-thirds fibrous loam, and one-third sandy peat or leaf mould, adding sand freely. The best time to repot is when the plant is beginning to grow. Good drainage should be provided, and a rather small shift given for the size of the plant. In winter it should be kept in a light position in the greenhouse, giving no more water than is necessary to keep the foliage from flagging, which will not often be the case. During the growing period give an abundant supply of water, and keep the plant well syringed overhead, and rather close, so as to encourage it. Do not discontinue watering until the growth is complete, then gradually leave it off, exposing the plant fully to light and air, so as to have the wood well ripened.

HARDINESS OF HYDRANGEAS AND VERONICAS (Idem).—Hydrangeas are hardy in sheltered situations, and so are the Veronicas; but they are best treated as half-hardy, wintering them in a cold pit, and protecting them from frost.

STOCKS FOR FRUIT TREES (Julians).—The best stock for the Apricot is the Muschel Plum, and it answers for both Peach and Nectarine trees. We are not aware that they can be grown on the Mahaleb Cherry; but we may state that we have Plums succeeding admirably on the Cherry stock, and we think the experiment worth trying.

COCKSCOMB STRAWBERRY (A. H. H.).—The Cockscomb Strawberry has large and downy leaves like those of the British Queen, but larger, and is of better habit. The fruit is very large, ovate, and occasionally cockscomb-shaped; skin pale scarlet; seeds prominent; flesh white, with a rosy tinge, richly flavoured.

APPLE AND CHERRY STOCKS (Idem).—The Paradise stock as commonly used in this country, is raised from pips of the Apple, and planted out in nursery lines as you describe. The Mahaleb Cherry, or stock, is a sort of Cherry of that name, of dwarf growth, and propagated by seeds, layers, and suckers.

PYRAMID FORMS BUSH FRUIT TREES (Idem).—We consider pyramids more profitable than bushes, as more of the former can be grown in or on an equal space of ground, but allowance must be made for the greater danger in pyramids of the fruit being blown off; but everything considered we prefer pyramids, and should plant such. If the situation were exposed to wind we would plant bushes, as their fruit escape better, and the trees are not so liable to be blown to one side. Pyramid Apple trees on the Paradise stock may be planted 4 feet apart, and Pears on the Quince stock the same distance; afterwards, when becoming too close

they can be afforded more room. It is better—*i.e.*, more profitable, to plant 4 feet apart, and give more room as required, than to plant at a greater distance, and crop the ground between the trees, as justice is by that method rarely done to either crop, and disturbing the ground about

fruit trees is destructive to the roots and lessens fertility. Pyramid Cherry trees are formed in the same way as pyramid Apple trees.
NAME OF PLANT (*D. B.*).—A Nephrodium, probably *N. arbusculum*. Capsicums are often larger than those you mention.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending December 8th.

DATE.	BAROMETER.		THERMOMETER.				Wind.	Rain in inches.	GENERAL REMARKS.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

BIRMINGHAM POULTRY SHOW.

WE can now speak more at leisure of the Birmingham Show. We will give the weights of some of the breeds where such qualities are of importance, merely premising that weight is only important where it is joined to other, and, in many instances, more valuable properties.

The adult Dorking cocks ranged between 12 lbs., and 10½ lbs.; these were mostly faultless birds. The cockerels, eighty-three in number, ranged between 11 lbs. and 9½ lbs.—such of them as appeared in the prize list; but many of them were not perfect. There was a defect we have often had to point out of late years—*viz.*, the spurs growing outside the legs. The average weight of the prizetaking Dorking hens was 8 lbs. each. The twelve successful pullets weighed 93 lbs.; the Silver-Greys were little behind in weight.

In the Cochín-China cockerels there were many bad combs, which disqualified birds that would otherwise have held good positions. Among the Cochín pullets and hens there were many with stained and marked hackles, otherwise they were classes of very high merit.

We repeat that which we said last week about the Game; the Black and Brown Reds and Duckwings were all perfect, save that in some there is a tendency to breed them too long in the thigh, and to look too much for weight. Many of the birds exhibited were fit for shake-bags; Blacks, Whites, Piles, Duns, and Brassy-winged seem disappearing, at any rate they cannot hold their own.

The same may be said of the Golden Polands, unless they increase in number and quality they must give way to their Silver brethren.

The Brahmas are now established and form large classes, both Dark and Light. We shall be glad to see the time when no sign of a vulture-hock will be seen.

We considered the Crève-Cœur cocks a show in themselves, and we anticipate popularity for them and the Houdans. We can say nothing for the La Flèche.

The result of Duck-breeding by the *cognoscenti* is a curious one. Some years since the Aylesbury was always heavy, the Rouen was a bird of feather; the latter having accomplished feather took up weight, and has now passed the Aylesbury in the race. The three prize pens of Rouens weighed 55½ lbs.—respectively, 19½ lbs., 18½ lbs., 18½ lbs.; the Aylesbury collectively 50½ lbs., separately 17½ lbs., 17½ lbs., 16½ lbs. We were much pleased with the Black Ducks. They improve every year, and are now all that was desired years since.

White Geese best the Grey and Mottled in weight—old White 55 lbs., 51 lbs.; young, 50 lbs., 40½ lbs. Old Grey, 55½ lbs., 38 lbs.; young, 45 lbs., 44 lbs.

Old Turkey cocks weighed 33 lbs., 32 lbs.; young 24 lbs., 23½ lbs. Two hens, old, 37½ lbs., 30 lbs.; young, 29 lbs., 26½ lbs. It will thus be seen that a pen as exhibited of old, containing a cock and two hens, might have been shown weighing 70½ lbs.

We were amused to find many persons during the show, speaking of the Aylesbury and Rouen as the edible Ducks, and putting the Black and the Call Ducks among the fauzy birds. It is a great mistake; both these breeds are excellent for the table, the former being distinguished, even among the good ones.

The amount of money taken at the doors was £1037; the number of persons admitted, 44,583.

It was throughout a deservedly successful meeting.

DETAILS OF POULTRY SHOWS.

THE Meeting called by advertisement was held on Monday evening, November 30th, at the Acorn Hotel, Birmingham, a considerable number of poultry and Pigeon exhibitors from various parts of England being present. There were many subjects freely discussed, and several resolutions unanimously adopted. See advertisement.

The Members of the Meeting, wishing to consult the convenience of the various shows as much as possible, expressed a wish that it should be understood they do not dictate to the Committees that they shall adopt the regulations; at the same time they thought it would be to the advantage of all parties if they could be carried out. It was the general opinion that large shows should appoint more judges, and instead of two or three persons having to judge the same classes, assign to each of them a certain number of pens, and then it would be seen who were the most competent to arbitrate, and if mistakes were made the judge committing the error would be known. It was thought the trimming of birds was not sufficiently taken notice of by judges, and if they used their discretion more frequently in disqualifying birds it would be advantageous.

OAKHAM POULTRY SHOW.

WHEN exhibitors send valuable fowls to shows they expect that they will receive ordinary care, but the way this Show was managed is a disgrace to the Committee. Instead of the show being held in the Riding School, as exhibitors had good reason to expect, especially at this time of the year, it was held in a tent, which was blown down two days previous to the show, and the ground saturated with rain. After it was repaired the fowls were penned and kept in this cold, damp, draughtly place for three days and nights—quite enough to injure them all, and make them unfit for exhibition again this season. Some of my birds arrived on Saturday morning, and the rest on Saturday night, so that it is probable they were two days without food. I think it right these facts should be known to exhibitors generally.—J. W.

DORKING POULTRY SHOW.

(From a Correspondent.)

THIS was held on the 3rd inst., in the Assembly Room, Dorking. With the exception of classes for adult and chicken Coloured Dorkings the competition was confined to members of the Society only.

This Show was a decided success, being far superior to any former exhibition in that town. Its chief characteristics are that, with the exception of aquatic fowls and Turkeys, it is confined solely to Dorkings; and though the prize list is particularly liberal, it is thrown open to all England by an entrance fee of 5s. per pen, whatever number of pens may be exhibited. I believe that next year a larger building will be available, which will add to the comfort of the visitors, and provide better accommodation for the birds; and, as the entries increase every year, this will be a necessity.

The cup in the adult class was deservedly won by Dr. Campbell, and that in the young class by Mr. Gellatly. This case was the only one

in which I should demur to the judging, and here, I think, it was decidedly faulty. The cup classes contained a most beautiful collection of birds, making it by no means an easy task to select the winning birds.

The local classes also contained birds, many of which would have easily won cups a year or two back. Many birds changed hands, as the prices asked, in numerous cases, were very moderate.

DORKINGS (Coloured).—First, D. C. Campbell, M.D., Brentwood. Second, H. Humphrey, Steyning. Third, J. Ivimy, Redhill. Highly Commended, J. Elgar, Osmanthorpe Hall, Newark. Commended, E. & A. Stanford, Eatons, Steyning. **Chickens.**—First, D. Gellatly, Meigle. Second, H. Humphrey. Third, Major C. W. Calvert, Ockley Court. Highly Commended, D. C. Campbell, M.D. Commended, E. & A. Stanford.

MEMBERS ONLY.

DORKINGS (Coloured).—First, J. Ivery, Dorking. Second, E. T. Bennett, Betchworth. Third, M. Putney, Dorking. Fourth, J. Attlee, Dorking. Highly Commended, J. Ivery. Commended, H. Wise, Brockham. **Chickens.**—First, J. Ivery. Second, M. Putney. Third, E. May, Dorking. Fourth, W. Fell, Wescott. Highly Commended, J. Ivimy. Commended, J. Clift, Dorking.

DORKINGS (Blue-speckled).—Prize, W. Griffin, Westcott. **Chickens.**—Prize, W. Griffin.

DORKINGS (White).—First, T. Sherlock, Dorking. Second, W. Attlee. Third, Mrs. J. Matheson, Holmwood. Highly Commended, A. Way, Betchworth. **Chickens.**—First, G. Cuhitt, M.P., Denbies. Second and Highly Commended, W. Attlee, Dorking. Third and Commended, Mrs. J. E. Matheson, Holmwood.

DORKINGS (Coloured).—*Cock.*—First, J. Ivery. Second, W. Fell. Highly Commended, M. Putney. Commended, E. May. *Hens or Pullets.*—First, J. Ivery. Second, F. May. Highly Commended, J. Clift. Commended, Major C. W. Calvert.

DORKINGS (Blue-speckled).—*Cock.*—Prize, W. Griffin. *Hens or Pullets.*—First, Withheld. Second, Major C. W. Calvert.

DORKINGS (White).—*Cock.*—Prize, W. Attlee. *Hens or Pullets.*—Prize, W. Attlee.

DUCKS (White Aylesbury).—First, J. Ivimy. Second, E. Kerrieh, Dorking. Highly Commended, W. Attlee. Commended, W. F. Watson, Dorking.

DUCKS (Any other breed).—First, J. Ivery. Second, G. Minter, Fatcham. Highly Commended, Mrs. E. Norris, Hatchford Parsonage, Cobham. Commended, Sir R. A. Glass, M.P., Ashurst, Headley.

GESE.—First, W. Attlee. Second, H. Wise.

TURKEYS.—First, Sir R. A. Glass, M.P. Second, E. Neal, Bury Hill, Dorking. Highly Commended, A. Way. Commended, Miss A. Lushington, Ockham Park.

DORKING (Fatted).—First, G. Ellis, Betchworth. Second, J. Ivery.

JUDGE.—Mr. John Wood, Westcott.

KILMARNOCK POULTRY SHOW.

THE Exhibition held in the Corn Exchange, on the 23rd of November, was a very successful one. The following prizes were awarded:—

SPANISH.—First and Commended, J. Crawford, senr. Beith. Second and Third, R. Blair, Kilmarnock.

DORKINGS.—First, J. Muir, Glasgow. Second, A. J. Mutter, Kilmarnock. Third, W. M. Groat, Kilmarnock.

BRAMA POOTRA.—First, A. Gibb, Ayr. Second, J. W. Taylor, Ayr. Third, A. Robertson, Kilmarnock. Commended, A. Geddes, Kilmarnock; H. Roxburgh, Galston.

SCOTCH GREYS.—First, J. Fulton. Second and Third, W. Craig, Kilbirnie.

HAMBURGS (Golden-spangled).—First, R. Cunningham, Stewarton. Second, H. Currie, Ardrossan. Third, A. Gibbs. Highly Commended, and Commended, J. Jardine.

HAMBURGS (Golden-pencilled).—First, W. Bachop, Paisley. Second, J. Armstrong, Longtown. Third, J. Smith, Stewarton. Highly Commended, J. Smith; J. Richmond, Kilmarnock.

HAMBURGS (Silver-spangled).—First and Second, R. Mackie, Stewarton. Third, D. Skeach, Stewarton.

HAMBURGS (Silver-pencilled).—First, W. Bachop. Second, J. Masgrave, Longtown. Third, M. Anderson.

GAME.—First, R. Stirrat, Dalry. Second, J. Baker, Stewarton. Third, J. Hodge, Hurlford. Highly Commended, T. Mackie, Stewarton.

GAME BANTAMS.—First, J. Glass, Ayr. Second, C. Aird, Kilmarnock. Third and Highly Commended, A. Morrison, Glasgow.

BANTAMS (Black).—First, J. Robertson, Kilmarnock. Second, J. Sharp, Johnstone. Third, J. Jardine, Kilmarnock.

BANTAMS (Any other variety).—First, J. Robertson. Second, J. Jardine. Third, A. Yendall, Galston.

ANY OTHER VARIETY.—First and Second, J. Allan (Crève-Cœur). Third, J. Pollock, Busby.

DUCKS (Aylesbury).—First and Second, A. Robertson. Third, Miss J. W. Picken, Craigie.

DUCKS (Rouen).—First, Second and Third, A. Robertson.

DUCKS (Any other kind).—First and Second, J. Robertson. Third, J. Dickie, Gatehead.

SELLING CLASS.—First, J. Masgrave (Silver-pencilled Hamburgs). Second, H. Currie (Golden-spangled). Third, A. Robertson (Rouen Ducks). Highly Commended, A. J. Mutter (Dorkings); J. Robertson (Ducks).

PIGEONS.

POUTERS (Any colour).—First and Second, J. Sharp. Third, J. McCrae, Kilmarnock. Commended, J. Glass. *Young.*—First, J. R. Adam, Ayr. Second, J. Senior, Kilmarnock. Third, W. Douglas, Crosshouse. Highly Commended, J. Sharp. Commended, D. Munn, Kilmarnock; A. Sim, Kilmarnock.

CARRIERS.—First, J. Kerr, Kilmarnock. Second and Third, J. Muir. Highly Commended, D. Munn. Commended, A. Wardrop, Kilmarnock.

TUMBLERS (Short-faced).—First, J. Muir. Second and Third, A. Millar, Kilmarnock. Highly Commended, J. Kerr. Commended, Miss E. M. Beveridge, Ayr.

TUMBLERS (Any other kind).—First, R. Machie. Second, W. Douglas.

Third, D. K. Mackay. Commended, A. Thomson, Kneekentiber; G. Brown, Kilmarnock.

FANTAILS.—First, J. Sharp. Second, T. Wilson, Stewarton. Third, R. Blair. Commended, W. Crawford.

JACOBIANS.—First, J. Wilson, Galston. Second, A. Morrison. Third, J. Sharp. Highly Commended, A. Mitchell, Paisley. Commended, R. Gibson.

PARRS.—First and Second, J. Muir. Third, J. Sharp. Highly Commended, Miss E. M. Beveridge.

TRUMPETERS.—First, J. Muir. Second, J. Sharp. Third, J. Thompson, Bingley. Highly Commended, W. W. Beveridge. Commended, A. Wardrop.

NECS.—First, W. W. Beveridge. Second, J. Morton, Newmilns. Third, R. Gibson. Highly Commended, J. Sharp.

COMMON.—First, C. Kerr. Second, W. McKinlay. Third, W. McCrae. Highly Commended, R. Stirrat. Commended, J. Muir.

ANY OTHER DISTINCT BREED.—First, J. Thompson. Second, W. W. Beveridge (Turbits). T. Baird, Galston (Turbits). Highly Commended, J. Thompson. Commended, J. Sharp.

SELLING CLASS.—First, A. Millar (Pouters). Second, J. Wilson (Jacobins). Third, W. Crawford (Fantails). Highly Commended, J. Secular (Pouters). Commended, A. Wardrop (Trumpeters); J. Sharp.

CANARIES.

CLEAN YELLOW.—*Cock.*—First, A. Kelly, Paisley. Second, T. Craig Third, J. Richmond, Kilmarnock. *Hen.*—First, R. Crawford. Second, and Third, J. Muir.

CLEAN BUFF.—*Cock.*—First and Second, R. Calderwood. Third, T. Craig. *Hen.*—First, A. Kelly. Second, W. McLuckie, Kilmarnock. Third, R. Watson.

YELLOW PIEDALD.—*Cock.*—First, G. Haddow, Corscill. Second, J. Crawford. Third, C. Aird, Kilmarnock. *Hen.*—First, A. Kelly. Second, R. Crawford. Third, J. Glasgow.

BUFF PIEDALD.—*Cock.*—First, G. Hamilton, Beith. Second, R. Stevenson, Galston. Third, W. Bryson, Darvel. *Hen.*—First, J. Fulton. Second, J. Glasgow. Third, G. McLure.

GOLDFINCH MULE (Yellow).—First, A. Wardrop. Second, J. Paton, Overton.

GOLDFINCH MULE (Buff).—First, J. Paton. Second and Third, G. Goudie.

GOLDFINCH.—First, J. Crawford. Second, T. McMurtrie.

SILVER MEDAL FOR THE BEST CLEAN BIRDS.—Prize, J. Muir.

JUDGES.—*Poultry:* Robert Paton, Esq., Kilmarnock; James Stevens, Esq., Ardrossan; James Holborn, Esq., Stewarton. *Pigeons:* James Hume, Esq., Glasgow; James Paton, Esq., Stewarton. *Canaries:* John Wren, Esq., Pollokshaws; Andrew Pringle, Esq., Dalry; William Orr, Esq., Beith; John Anderson, Esq., Kilmarnock.

BELFORD CANARY SHOW.

This was held on the 2nd and 3rd inst. The following is the prize list:—

BELOIAN (Clear Yellow).—First, W. Tinlin, Galashiels. Second, G. Nicholson, Newcastle. Third, J. Robson, Bobside, Morpeth. Very Highly Commended, W. Balmer, Stockton; J. Robson; Highly Commended, J. Baxter, Newcastle. Commended, J. Baxter; G. P. Norris, Berwick; J. Dryden, Kelso.

BELOIAN (Clear Buff).—First, W. Balmer. Second, R. Forsythe, Edinburgh. Third, B. Gilchrist, Barnes, Berwick. Very Highly Commended, G. P. Norris. Highly Commended, C. Lugton, Hillburn, Ayrton; W. Dippie, Edinburgh; T. W. Wark, Edinburgh. Commended, G. P. Norris; W. Tinlin.

BELOIAN (Marked or Variegated, Yellow or Buff not Ticked).—First, B. Gilchrist. Second, W. Balmer. Third, R. Hawman, Middlesbrough. Very Highly Commended, J. Bexson. Highly Commended and Commended, J. Dryden.

DON (Clear Yellow Glasgow).—First, J. Soulsby, Newcastle. Second, W. Tinlin. Third, G. Nicholson, Newcastle. Very Highly Commended, W. Crease, Edinburgh; G. Nicholson. Highly Commended, J. Kemp, Galashiels; W. Curry, Belford; W. Tinlin. Commended, J. Greenlees, Sunderland; A. Ferguson; A. Scott, Jedburgh; W. Crease.

DONS (Clear Buff Glasgow).—First, W. Alexander, Edinburgh. Second, J. Soulsby, Sunderland. Third, G. Nicholson. Very Highly Commended, W. Crease. Highly Commended, J. Murray, Belford; H. White, Westwood; J. Kemp. Commended, J. Greenlees, Sunderland.

DONS (Marked or Variegated Glasgow, Yellow or Buff not Ticked).—First, J. Ross, Edinburgh. Second, G. Greig, Edinburgh. Third, J. Cleghorn, Galashiels. Very Highly Commended, A. Ferguson; W. Dippie, Edinburgh. Highly Commended, J. Greenlees; S. H. Jeffrey, Jedburgh.

NORWICH (Clear Yellow).—First and Highly Commended, T. & J. Irons, Northampton. Second, J. Bexson. Third, T. Carrington, Derby. Very Highly Commended, S. Tomes, Northampton; G. J. Barnesby, Derby; J. Wynn, Northampton; G. Moore, Northampton. Commended, G. J. Barnesby; J. Young.

NORWICH (Clear Buff).—First and Second, E. Orme, Derby. G. J. Barnesby. Very Highly Commended, J. Bexson; E. Coko, Derby. Highly Commended, T. & J. Irons; W. Young, Belford. Commended, E. Mills, Sunderland; J. Wynn.

NORWICH (Marked or Variegated Buff or Yellow).—First, G. Shiel, Sunderland. Second, R. L. Wallace, Berwick. Third, J. Baxter. Highly Commended, R. Hawman; J. Young; E. Orme; J. Wynn; G. Moore.

NORWICH (Variegated Yellow with Dark or Grey Crest).—First, G. Moore. Second, J. Baxter. Third, S. Tomes. Very Highly Commended, W. Blakston, Sunderland. Highly Commended, J. Wynn. Commended, J. Bexson.

NORWICH (Variegated Buff with Dark or Grey Crest).—First, S. Tomes. Second, G. Shiel. Third, J. Wynn. Very Highly Commended, G. Moore. Highly Commended, J. Young. Commended, R. L. Wallace.

NORWICH (Clear Yellow or Buff with Dark or Grey Crest).—First, J. Young. Second, J. Stainsby, Sunderland. Third, J. Wynn. Very Highly Commended, R. L. Wallace. Highly Commended, J. Stainsby; J. Baxter; J. Young. Commended, S. Tomes; G. Moore.

CINNAMON (Clear Yellow).—First, J. Wynn. Second, R. Hawman.

Third, R. L. Wallace. Very Highly Commended, S. Tomes. Highly Commended, E. Orme; S. Tomes; G. Moore. Commended, J. Stainsby.
CINNAMON (Clear Buff).—First, J. Wynn. Second, G. Moore. Third, C. H. Angus. Very Highly Commended, J. Stainsby. Highly Commended, S. Tomes.

CINNAMON (Marked or Variegated Yellow or Buff).—First, J. Wynn. Second, K. L. Wallace. Third, J. Baxter. Very Highly Commended, J. Baxter; J. Wynn. Commended, R. Hawman; S. Tomes.

GOLDFINCH MULES (Marked or Variegated Yellow).—First and Very Highly Commended, G. J. Barnesby. Second, Third, and Highly Commended, J. Young. Commended, R. Paxton, Belford; T. Carrington.

GOLDFINCH MULES (Marked or Variegated Buff).—First and Third, J. Young. Second, G. J. Barnesby. Very Highly Commended, T. Carrington; G. Moore. Highly Commended, J. Robson; G. J. Barnesby; G. Shiel. Commended, J. Young; J. Robson; G. Shiel.

ANY VARIETY OF CANARY NOT BEFORE SPECIFIED (Open Class).—First, J. Baxter (Ticked Belgian). Second, T. Carrington (Silver-spangled Lizard). Third, W. Young (Ticked Norwich). Fourth, J. Jours, Belford (Ticked Belgian). Very Highly Commended, R. Hawman (Silver-spangled Lizard); C. Lugton (Ticked Don). Highly Commended, J. Wynn (Buff Crested Cinnamon). Commended, W. Bultmer (Coppery); S. Tomes (Marked Crested Cinnamon); J. Wynn (Marked Crested Cinnamon).

ANY VARIETY OF CANARY (Local Class).—First, T. Humble, Belford (Buff Belgian). Second, J. Murray (Ticked Don). Third, R. Hall, Belford (Yellow Norwich). Fourth, R. Tully, Belford (Ticked Don). Very Highly Commended, J. Jours (Buff Belgian); G. Richardson, Belford (London Fane). Highly Commended, W. Wear, Belford (Marked Cinnamon).

JUDGES.—For *Norwich and Cinnamon*, Mr. R. Pearson, Durham; for *Belgians, Dons, and Mules*, Mr. R. L. Wallace, Berwick.

PIGEONS AT THE BIRMINGHAM SHOW.

I MUST say that with one exception the management was all that could be desired. There is nothing of more importance in preserving the health of Pigeons in confinement than cleanliness; and delicate varieties, like the Almond and Short-faced, Owls, Toys, &c., easily acquire a fatal disease in a short time by its neglect. I regretted, therefore, to see the food of the specimens imbedded in their excrements, while a liberal supply of sand would have absorbed the moisture, avoided the danger of disease, and kept the feathers clean.

In the *Almond Tumblers*, Mr. Fulton, of Deptford took all prizes: the first-prize pen were well matched, the hen better coloured than hens usually are, and both true almond ground, with good heads and carriage. The cock of the second-prize pen had the best head I ever saw on an Almond or Short-faced, but he was a year or two too old for colour; the hen, a good bird and beautiful in colour. The birds of the pen taking third were a pair of high merit. The class altogether was very good, the best point being yellow or almond ground instead of red.

In the class of *Balds and Beards* the first place was won by Mr. Fielding, of Rochdale, with a pair of Blue Beards fully deserving the honour; the second place by Mr. Fulton, with a pair of Blue Balds, the cock rather too coarse, but the hen very good; the third by Mr. Oates, of Beshthorpe, Newark, with a pair of Blue Beards. The class rather good.

In the *Short-faced* class the first prize was taken by Mr. Crossley, of Elland, near Halifax, with a pair of Blacks, but I could not discover their claim to the distinction. Mr. Fulton's Red Agates were much superior in head and carriage. Mr. Fulton's Mottles also had a higher claim to the first place, for a good Mottle is a most difficult bird to breed, and the cock was decidedly a good bird. The second prize was awarded to Mr. Fulton for a pair of good Red birds, but not matching in colour. The third honour went to Mr. Ford, of London, for a nice pair of Yellow Mottles. It was a very good class.

Black Carrier Cocks.—This class was very good, Mr. Fulton again carrying off all three prizes, also the silver cup for the best Black in the Show. In my opinion the third-prize bird was the best in the class.

Black Carrier Hens were good as a class. Mr. Fulton was first with a most perfect specimen; Mr. Crossley second with a very good bird.

Dun Carrier Cocks.—Mr. Horner was first; Mr. Ord, second; and Mr. Fulton, third. I think the best bird was overlooked, it was exhibited by Mr. Fulton.

Dun Carrier Hens.—This class contained some very good birds. Mr. Fulton was again first with a grand bird, good in every point; Mr. Crossley was second with a moderate bird of rather short and thin beak, and too broad in skull. Mr. Fulton was commended for a far superior bird.

Carriers of any other colour in pairs.—This was a miserable class of only three entries. Mr. Fulton was first, and Mr. Ord, second. I believe this class ought to be divided into cocks and hens to meet with success, as many fanciers possess odd specimens in White, Silver, and Blue, but they cannot well match.

Red Pontor Cocks.—Mr. Rose, of Cransley Hall, near Kettering, was first with a very good coloured bird, but arched-backed; Mr. Bulpin, of Bridgewater, was second with a good bird.

Red Pontor Hens.—Mr. Rose was again first with a good bird in every point but colour.

Blue Pontor Cocks.—Mr. A. H. Stewart, of Birmingham, was first, and also obtained the silver medal offered by Mr. Rose for the best Pontor, with a remarkably good bird, in points and colour all that could be desired, as it measured 20½ inches in length, and 7½ inches in

leg. He is the "King of the Blues." Mr. Crossley took the second prize with a good bird on inferior legs.

Blue Pontor Hens.—Mr. Crossley took the first prize with a bird rather short in leg, and with foul thighs. Mr. Shaw, of Stainland, Halifax, was second with a fair bird.

Black Pontor Cocks.—Mr. Fulton was first with a very good bird. Mr. Heath, of Calve, was second with a good bird, but with too much white on the wings.

Black Pontor Hens.—Mr. Fulton carried off both prizes. The first-prize bird was of very good colour, in fact a grand hen.

White Pontor Cocks.—This was an exceptionally good class. Mr. Fulton was first and second. The latter bird was by far the best in the class, measuring 19½ inches in length, and 7 in leg.

White Pontor Hens.—Mr. Tegetmeier was first with a worthy hen with grand carriage, yet rather wide in legs; Mr. Fulton second with a fair bird, but rather coarse.

Pontor Cocks, Any other Colour.—The most insignificant class, and very wisely the first prize was withheld; the second went to Mr. Fulton.

Pontor Hens, Any other Colour.—Mr. Stewart carried off the first prize with a beautiful Yellow hen, good in points. Mr. Fulton was second with a very good bird.

The rather too much favour of so many classes to Pontor fanciers has not been appreciated. In the last Show there were four classes with ninety entries; while this year there are eight classes with only seventy-one entries!

Jacobins, Yellow.—Only eight pens. Mr. J. W. Edge took the first prize. The hen of this pen was splendid, but the cock rather coarse. Mr. Horner was second with a pair of good colour, but large and rather long in the head.

Jacobins, Any other Colour.—This was a rather strong class. Mr. Myrland, Ryde, Isle of Wight, was first with good Reds. Mr. Roys, Greenhill, Rochdale, was second with good Blacks, in caps and frills excellent, but foul in flight.

Babs, Black.—Mr. Crossley was first with a fair pair; Mr. Charnley, of Preston, second. The third prize was most deservedly withheld, as this was the most unworthy class.

Babs, Any other Colour.—Mr. Charnley was first with a good pair of Duns; Mr. Horner was second with Reds. Mr. Firth showed a pair of very good Yellows, the best in the class, but sadly out of condition, and to make them worse they were abundantly supplied with hempseed. The two classes last year numbered twenty-seven good pens, this year only nine pens! Are the fanciers of this beautiful variety getting weak?

Fantails, White.—This was a large and good class, numbering twenty-four pens. Mr. J. W. Edge, of Birmingham, occupied the most prominent position. He took the first prize and the silver cup for a pair of exquisite birds with very expansive fans, starting as it were from the extremity of the hackle, and possessing a great number of feathers. Mr. Yardley, of Birmingham, was next with a remarkably good pair. Another pair of his birds were highly commended. It would puzzle many judges to decide which should have the next place; however, Mr. Park, of Melrose, was third with a very good pen. The awards in this class must be very satisfactory to all who understand what a good Fantail should be.

Fantails, Any other Colour.—In this class also the two first places were assigned to the same exhibitors, Mr. J. W. Edge again being first with a very excellent and well-matched pair of Blues, which though fairly entitled to the first place had two slight defects, and if these could be remedied they would be perfect specimens—viz., in each bird in this pen the four primary tertials were missing, which, of course, detracted from their appearance. The birds had also yellow eyes, and although to many fanciers they may be no detriment, yet most will admit that the pearlsh-coloured eye is preferable. Some few were to be found in this class which could lay claim to the name of both Black and Blue; in fact, they would not be misnamed if they were called Chequers.

Trumpeters, Mottled.—Six entries formed this class, and, of course, it was not so well represented as so interesting and prolific a variety would warrant us to expect. Mr. Horner, Harewood, Leeds, was first with a good, large-sized, and well-muffed pair, but not well matched, the hen having much more white on her than her mate, which was a good coloured bird. Mr. Firth was second.

Trumpeters, Any other Colour.—Mr. Oates was first with a really splendid pair of Whites. All the points that constituted a good pair of White Trumpeters were embodied in that pair. Mr. Shaw showed a very good pair of birds, which were not noticed for some reason which I cannot trace, unless the birds proved defective in hand. Mr. Firth was second; Mr. Bulpin, third. This was a fair class.

Dragoons, Blue.—Only nine entries, which, taken together, were good. Mr. Crossley was first with his very nice pair of Blues, which are, undoubtedly, very good birds, but are now becoming too "heavy" in wattle and coarse in skull to hold their ground much longer. In this class Mr. Ludlow and Mr. Percival showed a pen each, either of which ought unquestionably to be placed second, in lieu of those of Mr. Shaw, which were much inferior, one bird being white upon the back, the other dark, which difference, together with general character, has been overlooked.

Dragoons, Red or Yellow.—These were represented by some very superior birds, those of Mr. Bulpin, which took the first place, being the most beautiful Dragoons of a uniform colour I ever saw, and fully

deserving the position they held, and, with good judges, will be difficult to beat anywhere. Mr. Ludlow was second with birds of a very good rich colour, and they fully merited the position allotted them. There were only two pens of Reds, both of which were bluish down the thighs and back. They are very difficult to procure of a good red colour throughout. It was a good class.

Dragoons. Any other colour.—In this class of eleven entries, Mr. Percival was justly first, with a very beautiful pair of Silvers. They were, indeed, handsome, and I believe were sold easily. They were very straight in head, compact in form, beautiful in colour, and in all respects a pair of Dragoons. Mr. Horner was second with a pair of Whites, sadly too coarse in head, and heavy in wattle, but in good condition, and looking quite at home in a pen. Mr. Ludlow and Mr. Allsop showed some very nice specimens—the former a pair of Whites, but rather soiled, the latter a very good pair of Silvers, the hen a little too dark for the cock.

Anticreps.—This large class, numbering twenty-eight entries, was not quite so good as has been brought into competition in this Show, although some are all that can be desired. It was evident that the best pair had been passed, being out of condition, but there were others also, which, according to the general standard, were unnoted, but merited prizes more than the two pens to which those honours were awarded, and this is partly acknowledged by the exhibitors. The first-prize birds, Blue Chequers, of Mr. Yardley's, did not match in colour, and the cock was rather an inferior bird. The second-prize Duns, Mr. Yardley's, deserved their place. The third prize was given to a pair of Duns, which were not nearly so good in any respect but that they matched in style better than several other pens—namely, one pair of Duns exhibited by Mr. Taylor, and two pairs of Dan Chequers exhibited by Mr. Taylor and Mr. Noyé. This class has successively proved large enough to be in future divided into two classes—viz., Blue, and Blue Chequers; Dan, and Dan Chequers. Competition would increase, and the extra prizes recompense the care and attention bestowed so widely on such valuable birds.

Nuns.—The first prize went to Mr. Balpin, Bridgewater, Somerset; the second and third to Mr. Banks, Runcorn, Cheshire. The second-prize pen to all appearance should have been placed higher.

Turbits, Red or Yellow.—First, Mr. Horner; second and third, Mr. Shaw—most deserving.

Turbits, Any other Colour.—First, Mr. Balpin, Blue; second, Mr. Horner, Silver. Mr. J. Thompson, Bingley, Yorkshire, showed a pair of Blacks which were much more attractive than the second-prize Silvers.

Owls, Foreign.—First and second, Mr. Fielding, jun.; the first Blues, the second Whites. The second, with the exception of size, are superior to the first in head.

English Owls.—First, Mr. Balpin; second, Mr. Watts, of King's Heath, Birmingham—well merited. I trust to see the last two classes a little stronger, as they are most worthy of attention.

Archangels.—First, Mr. Edge; second, Mr. Balpin. Pen 2700, belonging to Mr. Yardley, I believe was the best in the class, as the birds in the prize pens were rather bronzed on the wings, unless this is a fashionably introduced point.

Scallows.—First, second, and third, Mr. H. Paget, Birstall, Leicestershire. The first, a beautiful pair of Reds, found more than one customer, and were easily sold by auction for £6 15s., though entered for £5.

Runts.—First and second, Mr. Green, Saffron Walden, Essex; third, Mr. Yardley, worthily awarded by weight.

Any other Variety.—The pet class of visitors. In this Mr. Noyé, Birmingham, took the first with Satinets, pronounced by one of the Judges to be the prettiest pen in the Show. Evidently I was not mistaken when I wrote in this Journal that they had tired the old judges in awarding prizes to this variety. Equal first, Mr. Draycott, Humberstone, near Leicester—Frillbacks, a very good pair. The three second prizes went to Mr. Draycott, Mr. Yardley, and Mr. Paget, for birds all of the Ice-Toy stamp, or the same character of birds in different colours. The three third prizes were won by Mr. W. Banks, of Runcorn, Cheshire; Mr. Horner, Leeds; and Mr. Yardley; the two again of the German "chance variety," and the other a pair of Lahores, by Mr. Banks, which were rather out of place, as there was a pen of Dots shown by Mr. Bailey, jun., also a pen of Russians by Mr. Loder, far prettier.

In concluding my remarks, I must say that the duties of the Judges were rather too heavy, and I wonder how the three managed with 120 pens more than last year, especially those of Messrs. Relpeth and Esquilant, as Mr. Harrison Weir and Dr. Cottle only judged the Almond Tuoblers, the Carriers, and the Ponters, and the first two gentlemen all the other classes. I should like to know who thus arranged the work, and why Messrs. Weir and Cottle did not undertake also the Dragoons, and the Short-faced classes, including Balbs and Beards. However, this greatest of English shows has made an acquisition in the services of the two newly-appointed Judges, Messrs. Relpeth and Esquilant, and they have been most justly severe in disqualifying, which will do much good to future shows.—A FOREIGNER.

[We have received letters from Mr. Barnes, and others, all agreeing in praising the judgment displayed in assigning the prizes, and the firmness in disqualifying birds that were either coloured or not pinned. There were, of course, some oversights, despite the acknowledged vigilance of the Judges.—Eds.]

ARTIFICES OF THE PIGEON EXHIBITORS AT THE BIRMINGHAM SHOW.

ONE would have thought after what has been said and written in this Journal about the artifices that exhibitors of Pigeons use to obtain prizes at the various shows, that they would have taken the hint that has been put forth as regards the birds shown not being pairs, and also the handiwork displayed in trimming and colouring or dyeing the birds sent. But no! With an impertinence that is truly astounding they still persist in sending their two hens or two cocks, with the hope that they will delude the judges and they gain the award of merit; but the various and numerous cards of disqualification nailed above the pens at Birmingham this time prove that the judges are determined as far as possible to put a stop to such unfair practices, and to hold up the names of such as adopt them to the scorn of worthier exhibitors.

A man may be deceived with regard to a cock or hen bird, but there can be no excuse for dyeing or colouring a pen of birds. This is wilful, and evidently done with unjust motives, and is paltry and despicable. Yet such was the case with two Black Mottle Pouters exhibited by Mr. Stewart, of Birmingham, the black apparently coming off freely on to the white feathers of the birds. Happily the Judges instantly detected the artifice, and they were at once disqualified. But I do not think the matter ought to end here. I would have it that such exhibitor should be excluded from ever exhibiting again at Birmingham, and that he should be debarred from taking any prize at the then existing Show; and I sincerely trust that such a rule will be found amongst the other wise and prudent precautions already laid down by the Council to insure justice and fair play for every one; and I would further carry such rule, that in the event of birds dyed or otherwise coloured getting past the observation of the judges, that such birds should still be disqualified if so proved before the termination of the show.

I think all real fanciers will join heartily in this proposal, as at least one step in the right direction to protect the exhibitor who exhibits fairly.

I had hoped to have seen some notice taken of these matters in the last week's impression; but have no doubt that this week many, like myself, will express their opinions as freely as I have done, and with the same determination to try and put a stop to such unfair practices—I might use a stronger term.—CENSOR.

[We need scarcely say that we will do all in our power to put an end to these disreputable proceedings; and we are rejoiced that so competent and independent a judge as is "CENSOR" has issued this warning.—Eds.]

LARGE HIVES.

WHEN I introduced to the notice of the readers of THE JOURNAL OF HORTICULTURE the subject and the superiority of large hives, I deemed it wise to allude to the Stewarton hive and Neighbour's cottage hive. I did so with a view to give the reader a correct idea of what I meant by large and small hives, and incidentally to give the manufacturers of these hives a hint as to the desirability of enlarging their sizes. I did so with some hesitation, fearing that my remarks might be taken in a sense not meant by me.

A gentleman signing himself "A LANARKSHIRE BEE-KEEPER," has appeared in your pages, not only in defence of the Stewarton hive in its present size, but in bold antagonism to large stock hives; I am sorry he has not given his name and address, for I have a growing dislike to notice controversial remarks from gentlemen who withhold their names. As his criticisms may possibly influence a few readers not remarkable for close and accurate thinking, I will now try to guard them against being misled, by reviewing my reviewer.

After wisely passing over my remarks condemnatory of all hives made of wood, the "LANARKSHIRE BEE-KEEPER" comes to the question of large and small hives, and ventures to say that the disadvantage is greatly on the side of the large one in spring, owing, he says, "to the bees occupying only a small part of the hive in comparison with its size." It grieves me exceedingly to see a man, especially a Lanarkshire man, make statements he cannot substantiate. How does he know that large hives in the spring months are comparatively small in population, and without sufficient warmth to hatch the brood? I have never found such things happen in large hives under

good management. Another statement our friend makes is this, that the waste of eggs in a large hive is greater than in a small one, a statement so extraordinary and extravagant that I fancy it will be difficult to find another person, either north or south of the Tweed, who will believe it.

Again, he would have us believe that the Stewarton hive is large enough to hold some honey and pollen, and 63,000 cells for brood—that is to say “3000 eggs per day.” In my advocacy of large hives I have never gone so far as this “LANARKSHIRE BEE-KEEPER.” If he will satisfy me that there are deposited 3000 eggs in empty cells every day in a Stewarton hive, and 3000 bees produced every day, or room for them, I shall never again condemn this hive on account of its smallness. With an eye of honest scrutiny I cannot understand what induces this gentleman to go beyond the bounds of reason and possibility in his commendation of the Stewarton hive. Evidently he manages bees on the non-swarming system, whereas we go strongly for the swarming system of management where profit and a continuance of success are aimed at.

Will the reader just notice what happens where large hives are well managed and allowed to swarm? Very often each hive yields two swarms, but in a run of years three swarms from two hives will be about the average. In a moderately favourable year for prosperity the two stock hives and their three swarms will have 40,000 bees each at the end of the season—200,000 altogether. In the case of large hives each swarm is more populous than a smaller hive managed on the non-swarming system; very well, now suppose we take the honey from three of these five hives, and put their bees—120,000 in number—into the two selected for stock, what do we obtain? Two hives more than double the strength of those which have had no additions of bees. Such hives are neither cold in spring, nor are the bees slow to cover their combs. In 1867 I had only twelve swarms in September to divide amongst twenty-four hives, from these I had twenty swarms in May; and in June, 1868, one of the largest bee-keepers in Lancashire told me that no honey could be obtained here if hives were allowed to swarm, yet my swarms yield twice as much honey as his that are not allowed to swarm.

I am quite sure if my readers will adopt larger hives and manage them well, they will have no sympathy with the “LANARKSHIRE BEE-KEEPER,” when he expresses his detestation of large hives. I have both large and small hives in my garden; the small ones help me to increase the number of my hives, the large ones yield me profit. By-and-by I shall be able to work in an apiary every way excellent, and then the small castaways will be occasionally used for supers.

I am of opinion that if this advocate of the Stewarton hive had been in Manchester in the months of September and October last, to witness a number of Irishmen hawking, day after day, great dishes of pure honeycomb in large cakes, 12 inches square, cut out of large hives, he would hesitate before he again ventured to speak publicly of his detesting the use of large hives. Much of this comb brought from Ireland could not be surpassed for excellence, and generally realised 1s. 9d. per lb.

The “LANARKSHIRE BEE-KEEPER” says, if I would adopt and only half-manage the Stewarton hives, I would “find them very profitable, and be able to send to the market first-class honey, whilst the inferior which we now produce would gradually disappear.” This is rather too strong, and so is the following quotation:—“I would emphatically state that the whole world has not yet produced in quantity and quality honey equal to that obtained from the Stewarton hive.” I should fancy this expression of wild enthusiasm would have no more weight with thinking men than the sigh of a butterfly in love. As it is my intention to visit Lanarkshire next year in July, and stay fourteen days there, I earnestly hope that this gentleman will let me have his address, and permission to visit his bee garden; and if I find there what he talks about—results so prodigious that hives which took two men to lift have given place to the Stewarton hive, I can assure him that I will use what little influence I possess to bring it speedily into repute. At present I have no faith in the worth of wooden hives—no faith in the present size of the Stewarton hive, and, I regret to say, less faith in the recommendation he has given of it.

The “LANARKSHIRE BEE-KEEPER” has in one instance, perhaps unintentionally, misrepresented my meaning. He makes it that Mr. Pettigrew says if these Stewarton hives were “properly managed, much more honey would be obtained.” I never dreamed of such a thing. My words are “If these hives were twice as large and properly managed,” &c. His remark

about “the inferior run honey of large hives gradually disappearing” is another bold stroke. The markets of Great Britain demand ten times more run honey than honeycomb, and while this demand lasts bees will be managed so far as to produce it.—A. PETTIGREW, *Brighton Grove, Manchester.*

GREAT MEETING OF GERMAN BEE-MASTERS HELD AT DARMSTADT.—SEPT. 8TH, 9TH, & 10TH.

THESE meetings of bee-masters held periodically in one after another of the principal towns of Germany, show what a point bee-keeping has reached in that country, and are most interesting as well as advantageous in their results. The meeting which was held this year at Darmstadt, the capital of the Grand Duchy of Hesse, was attended by a large number of the celebrities of German bee-keeping. Some well-known names, including Baron von Berlepsch (who is suffering from a stroke of paralysis, but growing better), are missed from the list, but still a meeting attended by such men as Dzierzyn, Von Hruschka (the inventor of the centrifugal comb-emptying machine), Vogel (introducer of the Egyptian bee to Germany), Dalhe, Koehler, Professor Leuckart, of Giessen, perhaps the first authority of the day on the natural history of the bee, a Greek Priest from Croatia, Marchesi Crivelli, the great reformer in Italian bee-keeping, from Milan, to say nothing of many others more or less known, from all parts of Germany, and several from France, could not fail to be interesting. Great facilities were also afforded by the fact, that almost every railway company in Germany and Austria conveyed bee-keepers or other visitors to the meeting, as well as articles for exhibition, at fares generally 50 per cent. or more reduced.

The first day of the meeting was Sept. 8th, and at half-past ten the President, His Excellency Herr von Berchthold, opened the proceedings, by welcoming the visitors in the name of H.R.H. the Grand Duke, who had placed his orangery and adjoining grounds at the disposal of the meeting, and addressed the assembly in a short speech, followed by two other addresses by the Mayors of Darmstadt and Bessungen.

The President then read out the rules for guiding the speakers, and the real business of the day was commenced by a speech by Professor Leuckart, enforcing first of all the necessity of learning theory as well as practice, in order to become a successful apiarian. He then proceeded to notice the points of similarity and difference in their habits between hive bees, wasps, ants, and humble bees, dwelling especially upon the extraordinary fertility of the queen bee.

The first subject upon the programme then came on for discussion. “1, What is the cause of the difference of size in queen bees? 2, Are the larger queens to be preferred to the small, and why? 3, Is it in the bee-master’s power to insure the production of large queens?”

These questions had been proposed by Dzierzyn, who ascended the speaker’s platform amidst a storm of applause. The substance of his remarks was: 1, That the difference in size is caused by difference in food during development, and depends, therefore, much upon whether the queens be bred during the time when there is abundance of pollen or not, pollen being, in fact, the element of their food which is of most importance in this respect. 2, That although smaller queens are, often at least, as fruitful as large ones, yet that the advantages of size in other respects are great, as, for instance, if the queen is to be caught, and especially because experience has shown that large queens are annually impregnated in a much shorter time than small ones, a difference sometimes, especially in cool weather, being observed of ten days. The third question is answered mainly in the remarks on the first, merely adding, that the fewer queens that are being bred at once by one stock, the larger they are likely to be.

Dr. Pollmann, from Bonn, thought that the difference in size depended much on the age of the grubs in the case of artificially-bred queens, for that a grub which had been fed four or five days with common food, could not develop to the same size as if it had all along enjoyed royal food; and also on the fact that the egg naturally destined to become a queen is kept warmer at the first than other eggs. As every bee-keeper will allow, large queens must be stronger than small ones, and to produce large queens we must always take care to commence with the egg at as early a stage as possible.

The second subject came then in order. “What is the result of all that has appeared in the ‘Bee Journal’ during the last year upon foul brood?”

This question had been proposed by Baron von Berlepsch, and, owing probably to his absence, the discussion assumed a somewhat desultory character. The substance, however, was much as follows—Dr. Preuss, a scientific microscopist of some authority, and an experienced bee-keeper, and Professor Leuckart, unhesitatingly attribute the worst kind of foul brood to the presence of a microscopic fungus, similar, probably, to the one affecting the silkworm in North Italy. It was also remarked that foul brood had much increased since the introduction of the Italian bee. The fungoid theory was also supported by some of the non-scientific bee-masters present, as affording a satisfactory explanation of many of the details connected with foul brood.

Professor Leuckart thought it probable that the eggs (but, of course, only in the worst cases) contained already the germs of the disease, an opinion which was opposed by those who alleged cases where they had saved the queens of condemned stocks, which had afterwards always produced a healthy succession.

Upon the question how to deal with foul brood, the opinion was almost general, that the stocks, some said the hives too, must be destroyed. Others, again, and amongst them no mean authorities, maintained that they had cured foul brood by a process recommended by the Rev. Mr. Schieberle, of Moravia, at the meeting of German bee-masters held at Brünn, in September, 1865.* It seemed also probable, that in many cases foul brood arose from feeding bees with the impure honey imported from Havanna and other places. The next question on the programme was—

"Whether foul brood is a result of using hives with moveable combs, and not rather of imprudence when giving them drink in winter?" Unfortunately Mr. Kleine, whose question this was, was detained at home by domestic affliction; but in his stead Mr. Dzierzon remarked, that though, doubtless, in the hands of inexperienced and incompetent bee-keepers, the system of moveable combs had its dangers, yet, as a matter of fact, it was the easiest, if not the only means of discovering foul brood and overcoming it. He could not understand the meaning of the second half of the question, and had no idea what could be passing in Mr. Kleine's mind to make him connect foul brood with giving bees drink in winter.

Dr. Busch remarked that, possibly Mr. Kleine had formed his opinion from some scientific articles which had appeared in the Hanoverian Bee Journal of which he is the editor. A Mr. Lambrecht had there made known the results of various chemical investigations, which had induced him to attribute foul brood to the bees feeding upon pollen which had been wetted and in consequence had fermented.

The next question discussed concerned some details in the construction of hives (first introduced by Dzierzon), with moveable combs, and since used with but slight modifications throughout Germany. We may pass this by as having little interest for English bee-keepers.

After this followed the question:—"Whether there are localities so absolutely unfitted for keeping bees, that in spite of all the experience and pains of the bee-master, the best stocks, if moved thither, die off in a short time?"

The only speaker to this question proved that bee-keeping might be impossible in some localities owing to neighbours poisoning the bees. After keeping bees successfully for forty years, he had, owing to the disbolical behaviour of a neighbouring manufacturer, lost in four years the whole of his bees, above £100 in value.

This led naturally to the question next in order, only interesting to Germany, as to the desirability of some laws as to bee-keeping.

After this Mr. Dzierzon spoke to one of his own suggestions—1st, "At what age do young bees first leave the hive and first gather honey?" 2nd, Would it be advisable, without reference to wintering, to hinder the breeding of bees which cannot gather any honey in the current season?"

Mr. Dzierzon remarked, that he had been induced to suggest this question in consequence of statements in Baron von Berlepsch's new edition of his bee book, in which it is stated that young bees begin first to gather honey in about thirty-five days, and that, consequently, it is advisable to prevent the increase of brood from about thirty-five days before the end of the honey season. Dzierzon believes that a young bee may leave the hive when three days old, or remain at home for as

many months, so that no precise number of days can be given. If there are plenty of workers, young bees would remain longer at home; if there were few old bees, as when a hive has been moved, the young bees would gather sooner. This he could assert from experience. And the second suggestion was grounded upon a mistake, for the activity of bees depends very much upon the amount of brood. If, therefore, for the last thirty-five days they had but little or no brood, they would gather comparatively less honey.

Mr. Vogel had seen young bees, after careful observation, come out of their hives when six or seven days old, but only in isolated cases. As a rule the eighth or ninth day would be the earliest, and dependent also upon circumstances of temperature, wind, strength of the stock, &c. Young bees do not gather honey till sixteen days old, as is proved by the fact that they starve under that age if left in a hive without honey or older workers. He agrees, therefore, on the whole with von Berlepsch as regards the first part of the question. As regards the second half, Dzierzon has not understood von Berlepsch, who does not say that one should not suffer any brood after a certain time, but that one should not suffer unnecessary brood, a mistake often made by beginners. And von Berlepsch's remarks are intended for places with very short honey harvests.

Mr. Köhler agreed with the last speaker, and remarked in addition, that the question how old the bee is when she first leaves the hive had a very important bearing upon the question of uniting weak stocks for the winter, an operation which he thought was usually undertaken too late in the year. It should be done before, and not after, the end of the honey harvest.

The next question on the list was "Whether it be possible to hinder drone brood in hives with moveable combs without having recourse to the old method of cutting out drone combs?"

Mr. Daths was of opinion that it was better not to let the bees build drone cells, by filling up any empty space in the breeding room of the hive with worker comb so soon as the bees begin drone cells. To suffer bees to build drone combs, and then to cut them out involves a great waste of honey, and a great loss of time for the bees, who build drone cells over and over again. By filling up the gaps, we should probably have young bees in the same space where, but for this, we should still be cutting out drone comb. Further, the bee-keeper saves himself the time and trouble he would otherwise necessarily have to devote to examining his hives, and cutting out the drone cells. Of course in the space devoted to honey the bees may build as much drone comb as they please. The speaker had for eight years allowed no drone brood where he did not wish it, and this without any cutting-out. For this purpose it is necessary, 1, That there should be a division between the brood room and honey room, so long as the bees wish to build drone cells. 2, The bees must not be allowed to build in the breeding space after they cease to build worker cells. 3, In spite of all care, some drone cells are sometimes built in the breeding space. These should be at once removed to the honey division, using in fact for this part of the hive all the drone cells one can bring together.

The speaker then added. 1, That worker comb should never be destroyed, but either kept for feeding the bees if necessary, or, 2, Emptied by means of the centrifugal machine, and the empty comb used again. 3, Every means possible should be employed to secure a good store of worker comb from artificial swarms, late swarms, &c., and others which cannot be wintered. 4, We can compel any hive to build worker comb by reducing it to the condition of a swarm—i.e., by taking out nearly all the combs. 5, We may take out all perfect combs from a hive with a young queen, the bees will then build worker cells. 6, and lastly, When compelled we may use artificial comb foundations. These conclusions were supported by Messrs. Hopf and Huber; the latter also suggested that it would often be a good plan to remove the old queen with the drone combs in order that the bees having then a young queen might build worker cells, but it should not be forgotten that till the young queen is ready to lay, only drone cells would be built if the bees were allowed access to empty breeding space.

The proceedings of the first day were then concluded with a few words from the President, and the appointment of judges for articles exhibited.

NEW AND OLD BOOKS.

Peter Parley's Annual, 1869. London: Ben. George.

We are not about to lecture upon the wondrous alteration for the better that has occurred within the last quarter of a

* We shall give a description of Mr. Schieberle's mode of curing foul brood in an early number.—EDS. J. OF H.

century in books for the juveniles of this and other lands. Among them none excels, in combining the amusing and beneficial, "Peter Parley's Annual," and we commend it to all who purpose giving a Christmas or New-year's gift to their own or their friend's "boy." But we should not have felt justified in noticing it if it had not contained a chapter "About Pigeons," and several chapters about "A Wonderful Little People." Now, these "little people" are bees, and it so happened that when "Peter Parley's Annual" was placed on our desk we were turning over the leaves of a book about the same "wonderful little people," but it is a book nearly three hundred years old. The information about bees in "Peter Parley's Annual" is good, because derived from Langstroth, the American apiarian, yet the old volume contains good information too, and is so quaint and suggestive of the style of bee-lore in the reign of Queen Elizabeth, that we must print a few extracts. It is entitled, "A Treatise concerning the right use and ordering of Bees: newlie made and set forth, according to the authors owne experience (which by any heretofore hath not been done). By Edmund Southerne, Gent.

Better late than never.

Imprinted at London by Thomas Orwin for Thomas Woodcocke, dwelling in Paules Churchyard at the signe of the blacke Beare. 1593."

The dedication is to "The right worshipfull Mistres Margaret Astley, wife to John Astley Esquier, Master and Treasurer of her Majestie's Jewels and Plate, and Gentleman of her Highnesse Privie Chamber," and reminds his patroness that he had studied bees during "fourteeue yeares," and that she had "had some triall of his skill."

He goes on to say, "If you lay out ten pence for two hives about the beginning of June, and put therein two swarms, they can be no lesse worth than ten shillings, and your hives againe, before Bartholomewtide following. Then judge what gaines after that rate there would arise, if a man had but 40 stocks (or stalles) as some tearme them: for if you have 40 stalles at the beginning of spring, there is no doubt their increase will be 40 more before Bartholomewtide following, whis is in al 80, and then you may sell 40 and keepe 40 for increase, which 40 so sold will yeld no less than 40 crownes, with your hives againe."

Bees, he states, "Never settle on Elder or Ewe" (Yew). The hive's aspect should be S., S.W., or W.

"The best time is to have your hives made about Christmas, for then you may have them better cheape, and straw is best in season, and the byers that they bind them withall are then strongest, and will indure the longer, but in any wise let not your hives be above 15 or 16 rolles at most, both of great and small; but if your hives be made of twiggas, as in some countries they use, so they containe not above halfe a bushel a peece, it is enough."

To prove that great hives cannot be profitable "when they should breed bees, they are busied filling their hives, for untill the hives be full of combes they will not swarme."

"To dresse hives before you put in Bees pryne and cut away all little tickling straws." "Spray your hive" with six sticks at different heights, "for staying the combes—and sprinkle the inside with a little honey and water."

"To place your Bees where they have the sun longest, hole towards the south, for that the south wind never bloweth so cold as other winds." Stocks to be "at the least three foote asunder," and far from bells and noises.

"Yong bees come to full perfection in 15 daies at the nttermost." Honey cells and brood cells are alternately; the young bees are fed on honey; though not sure, he does not deny that the bees "sit upon the egges."

"One M. Hill of London in his book intituled 'The Gardeners Labyrinth,' sheweth the manner how Drones should be killed." "It is a great folly," "for although the drones labour not abroade, yet that which the other bees bring home, they doe both helpe to worke into combes, and also to unloade the bees of their burthens." Bees kill them "when they thinke good." "Drones do breed."

In swarming time "hold up the stocks to facilitate their egress—never sting them, nor fly away." "When the swarme is up it is not good to ring them, as some doe; nay, it is a common thing where there is no experience, to keepe a stirre and lay on either with a bason, kettle, or frying-pan, taking great paines, and having little thanks, for by such meanes they make the bees angrie and goe further to settle." He thought the drones led the swarm, "for if there should a master bee to forth with the swarme, who shall rule the old stocke? Then

thou wilt say, there is a master bee for the stocke and another for the swarme; then it is not likely there is a king, for that love and principallitie like no equalitie."

He adds a story about the vicar of "Honeyborne, within the Vale of Evesham in Worcestershire," dividing two swarms that had joined, giving one to each of two neighbours, but the swarms united again next day.

"It is not good to have more than one swarme of a hive; otherwise both the old stocke and the second swarme are weak. Raise the stocke upon three bricks to prevent a second swarme, but take the bricks away at Bartholomewtide."

"The signe to know when the Bees will swarme," is that "You shall heare one Bee make a noyse as if it were the sound of a little bugle borne in the summer evenings."

To know whether your Bees will live or die. "About Bartholomewtide poyse every stocke between your hands, and so many as to your judgement weigh above 23 or 21 pounds, you may be sure will live all that winter following." Allow 6 lbs. for hive, 3 lbs. for wax, 13 lbs. for honey, "which is about five quarts."

"At Bartholomewtide clean the floor board, and plaster the hive to it. Stop the entrance all winter, except a quill to admit air. In the spring clean the floor board about 21st of March, and open the entrance."

OUR LETTER BOX.

USEFUL CROSS WITH DORKINGS (*H. A.*).—We should run a Brahma cock with Dorking hens to insure such qualities as you desire. It is by far the best for those who wish to keep only one breed. The greatest layers are non-sitters, and it is a mistake to mate them with birds that perform all the duties of breeders.

BLACK OATS AS FOOD (*E. J. S.*).—Yes, but the fowls will not take them as readily at first.

USEFUL FOWLS, GESE, AND DUCKS (*A. Subscriber*).—We recommend you as we have done above, to cross between a Brahma and Dorking. You will only supply your table with eggs in the winter by keeping pullets of the proper age for laying. It is not the province of any particular breed to lay in the winter. After they have once laid and sat, they fall into the natural groove, and breed in the natural season. This is neither December nor January. The Toulouse Geese are the largest and most prolific, but they are non-sitters. Ronen are very good Ducks, being large and prolific.

FOOD FOR POULTRY (*J. S. C.*).—No food is better for fowls than ground oats. The mixture of potatoes is bad. Potatoes are bad food for poultry. They make fat, and they induce disease of the liver, but they make neither bone nor flesh. The way in which fowls will starve on barley is this: If they were put in a place where there was no scratch, no dust, gravel, grass, or dirt—nothing but a painfully clean flooring, and they were fed on whole barley only, they would after a time starve on it: Ground oats, varied at times with barley or Indian meal, kitchen scraps, and crusts—if they have no grass run, large sods of growing grass, cut with plenty of earth—and refuse vegetables, especially lettuces, form a good and wholesome dietary.

FOOD FOR PIGEONS (*Ignoramus*).—Chicken rice would do for your Pigeons as part of their food, but never give it alone day after day. Indian corn is excellent; oats we do not recommend. The rice and Indian corn are not to be cooked or soaked, but you may crush the latter if you keep very small Tumblers. To keep Pigeons in health vary their food.

ARTIFICIAL HEAT FOR PIGEON HOUSES (*Birkenhead*).—We never knew or hear of Pigeon houses being warmed by artificial heat. If your wooden erections are backed by a good wall, and all cold draughts of air excluded by the boards being well joined together, no heat will be needed. Reed or straw is sometimes laid inside the woodwork, and well plastered over, and a skirting of bricks used at the bottom. These are excellent plans, as we can speak from experience, and the Pigeons have done well in such houses. In very cold weather feed your birds extra well, adding hempseed.

CANKER IN PIGEONS (*E. D.*).—You most likely bought a diseased bird, and that gave the canker to your others. Remove very carefully the lumps, and apply caustic. This must be done thoroughly. Canker is supposed to come from confinement, want of condiments, or drinking dirty water, and is infectious.

VULTURE-HOCKED COCHIN-CHINAS.—BREEDING AGE OF HENS (*Lemon Biff*).—Vulture hocks are always hereditary, whether from cock or hen, and we strongly advise you not to breed from such. You may breed from Cochin hens up to four years old. They will breed longer, but not profitably, as they fill the room of younger birds. As at four years they will have lost their beauty, it is well to be sure they once had it.

BERKSHIRE HIVE (*J. N. B. P.*).—We have published drawings and a description of this hive, and the favourable opinions of those who have used it. If you write to the maker he will give you fuller information.

VARIOUS (*C. A. J.*).—The dwindling of the population of your stock was doubtless owing to the loss of its queen, a misfortune which is very likely to arise in bee houses from young queens mistaking their hives on their return from their wedding flights. The bit of comb which you sent appeared perfectly healthy. The particle of greenish yellow matter seems to be thickened and nearly dried-up honey. The white stuff is a little mildew, and the minute creatures are common Acari or mites.

BASKET-MAKING (*R. T. C.*).—A correspondent asks for the name of any manual for teaching the art of basket-making. There are many hours when boys and men in country villages could profitably employ their time in the manufacture of baskets, wicker protections for plants such as those described by Mrs. Loudon, &c., and he would willingly assist in poor neighbours in adding this to their scanty means of earning a livelihood. He also wishes to be informed what is the best way of purchasing osiers, and at about what rate they are to be had. Any of our readers will oblige us by answering these queries.

WEEKLY CALENDAR.

From observations taken near London during the last forty-one years, the average day temperature of the week is 44.2°; and its night temperature 32.9°. The greatest heat was 54°, on the 18th, 1865; and the lowest cold 17°, on the 19th, 1859. The greatest fall of rain was 1.13 inch.

CUCUMBER CULTURE.—No. 1.

T is generally considered that the Cucumber is a native of the warmer countries of Asia. It was cultivated in Egypt at a very early period, but whether indigenous to that country or to any part of Africa does not appear in any work I have had access to. We find the Cucumber largely grown at Rome for the table of the Emperor Tiberius, and artificially brought forward or cultivated, so as to furnish fruit throughout the year. The means

were not very different from those now employed in this country. Frames were used, filled with hot dung, and the open part covered in with thin sheets or plates of tale, through which light was admitted. Tale, in respect to the amount of light which it would admit, would be about equal to oiled paper frames, which every reader of John Abercrombie will know were extensively employed in this country at no very remote period. I have heard it stated that Cucumbers could not be produced all the year round with no more light than that transmitted through tale or oiled paper, and some would discredit the statement as to Cucumbers being supplied throughout the year to Tiberius's table, saying that it was not until the adoption of glass that Cucumbers were always in season. It should be borne in mind that what would not answer here might do so elsewhere, and that the light of an Italian sky is much more clear and powerful than that of England. Pliny mentions baskets and vases in which Cucumbers were reared and grown, and this so that they might be taken under cover when the temperature was unfavourable, and placed outside when the air was warm and genial. The same author goes even further, and says there were beds mounted on wheels, the plants thereby being easily moved under cover when the days or nights were cold, or taken out when the weather was warm. I mention these matters merely to afford some proof of our not being in many things so very far in advance of a race that preceded us. It is of little or no moment to us to be informed when or how Cucumbers were first introduced into this country—that I could never discover—but we are aware good Cucumbers have been for a long time, and are now, produced in this country, and that there are certain things essential to success in their cultivation.

The requisites for successful Cucumber culture are—1st, A good, rich, light, open, sweet soil. 2nd, A good uniform bottom heat, and a steady top heat, but higher by day than night. The bottom heat should be 75°, and not exceeding 80°; and the top heat may average 75°, or correspond with the bottom heat, but at night it should be less than the latter, or from 65° to 70°; or it may in severe periods fall to 60° at night, and in the day it should be from 70° to 75°, and from 80° to 85° or 90° in bright weather. 3rd, The soil ought at all times to be moist, without saturating it at one time, and having it dust dry at another; and the atmosphere should be moist, never dry; but not so much so in damp weather as in bright, nor should the moisture be so great during the day as at night. 4th, All the light pos-

sible should always be afforded, especially in the winter, spring, and autumn, it being easy, by a thin shading, to modify the sun's rays when too powerful, which, however, is not often needed. Lastly, Air should be given whenever it can be done without lowering the temperature, it being well for the temperature to advance with air-giving; and always diminish the amount of air by or before the time when the maximum temperature is reduced by the external air. Avoid cold currents, and by no means have for any length of time a close confined atmosphere.

Soil.—The best soil that I have used for the Cucumber consisted of the top 3 inches of a pasture where the soil was neither heavy nor light, but a good hazel or yellow loam. This I lay up in ridges not more than a yard wide, and first put a layer of turf, and then an inch in thickness of fresh cow dung or sheep droppings, if I can obtain them, next a layer of turf, then dung, and so on, making the ridge about as high as it is wide. This, after it has been in the ridge for six months, is chopped up, and used rather rough without any admixture whatever. For winter forcing, however, I do not consider it open enough, and therefore add one part of good fibrous peat, which contains a considerable amount of white sand. The peat has the property of keeping the soil sweet, and in that way preserving the roots; whereas these, in soils that are closer and heavier, are liable to die off. Some grow their winter Cucumbers in peat alone. This I have tried, and I have found it answer very well, especially when dung heat is employed, and the roots can have access to the dung, but it is hardly rich enough for plants grown in beds or borders by the aid of hot-water pipes or flues, consequently turfy loam and leaf mould should be added to it; two parts turfy loam, and one part leaf mould added to one part of peat, make an excellent compost for the growth of winter Cucumbers. The soil, whatever it be, should never be such as will lie close, and with repeated waterings become a heavy soapy mass; but, on the contrary, it must be friable and porous, so as to admit of the free passage of water, and be readily penetrated by the roots. The loam may not always be so friable nor so turfy as desirable for the free passage of water and the roots, and in that case less of it should be employed, and more peat or sand.

Soils of the above descriptions are not always to be obtained. Where they are not, a good substitute may be formed by mixing with light garden soil an equal quantity of rotten hotbed manure or leaf mould. A first-rate compost is formed of light garden loam placed in layers with fresh horse droppings and cow dung, commencing with a layer of soil 6 inches thick, then putting on layers of horse droppings and cow dung, each 3 inches in thickness, then one of soil, forming the whole like a potato hog. This compost should be turned over twice or thrice in dry weather, and at intervals of two or three months, and in twelve months it will form a suitable soil for summer Cucumbers; but for winter-fruited plants it is scarcely open enough, and should be rendered more free, even if we go to the extent of mixing small gravel or grit with it, which will in most cases make it suitable.

It is not uncommon to see Cucumbers growing very

vigorously and producing fine fruit where common garden soil is employed, but this will in most cases only occur in summer when the days and nights are warm, and the amount of light considerably more than in autumn, winter, and spring. It should be considered that Cucumbers are not to be had by the same means at Christmas as they are at midsummer, and if they are wanted in winter provision must accordingly be made for their production. The best means for that purpose is a house with hot-water pipes for furnishing bottom and top heat; but where the necessary appliances are not provided, and fruit is not required in winter, it is well not to attempt forcing very early, but wait until there is a prospect of being successful with the materials at command. For the growth of Cucumbers for outting in April and through the summer, a dung bed and frame with two or three lights answer very well, and as this is the mode most commonly in use, I shall treat of it first.

DUNO BEDS.—The materials for the seed bed should be in readiness by the middle of January. Good stable dung is best, and a quantity sufficient to form a bed for raising the plants should be thrown into a heap, mixing the long with the short, and the wet with the dry. If there is a large proportion of dry long litter, it will be well to throw it into a heap by itself, giving each layer a thorough soaking with the drainings from the dunghill or with water, beating it well with the fork, and, when thoroughly moistened, it may be thrown into a heap with the short litter, and well incorporated. It should be allowed to remain in the heap until it becomes hot, and then be turned, mixing carefully together the long and dry with the short and wet, and putting the top at the bottom and the outside inside. If the litter is in any part dry moisten it as the work proceeds, and when it again ferments and becomes hot, turn it again, and see that there are no dry patches; if there are, let them be well watered before being mixed with the mass. It will soon become hot, then turn it again if very strawy and the steam rank; but with good stable litter twice turning will be sufficient, and the dung will be in a fit state for forming into a bed when the third heating or fermentation becomes general.

A warm, sheltered situation ought to be chosen for the bed, and though it cannot be too well screened from the points of the compass between east, north, and west, yet the less obstruction to the full light of the sun, and especially from the east to the south and west, the better. For raising the plants a small one-light box or frame will answer as well as one of larger size. Mark out a space larger every way by 6 inches than the frame, so that when the bed is formed it will be 6 inches wider than the frame both at the sides and ends. It must, therefore, be 1 foot wider and longer than the frame. Commence forming the bed by placing a layer of the longest dung on the bottom, then layer after layer of the hot dung, well shaking and mixing the materials of each, putting them on evenly, and beating with the fork, so as to render each layer compact. The sides should be built erect, and of the coarse material, keeping the small in the centre and at the top of the bed. The bed should be carried up to the height of 4½ feet at the back and 4 feet in front, a one-light box being used, but if a two-light, 6 inches less in height will suffice.

After the bed has been finished, put on the frame and the light or lights; keep close until the heat reaches 80°, then push the light down a little to allow the steam to escape, and in about a week the surface of the bed may be evenly covered with 6 inches of old tan, light dryish soil, or other material for plunging the pots in. In three days the materials will be warmed, and a thermometer inserted in the bed to the depth you propose plunging the pots will indicate the temperature; and if the temperature be low at the first examination—say, 70° or 75°—and on the next day 80° or more, the heat will in all probability rise considerably higher, and it will not be safe to plunge the pots in the material; but, to save time, seed may be sown and the pots set on the plunging material, but not plunged until the heat becomes regular; and when at 80°, and not likely to exceed 85°, the pots may be plunged, partly at first, and then deeper as the heat becomes less violent.

SOWING, AND MANAGEMENT OF THE SEEDLINGS.—For spring and summer use the beginning of February is a good time to sow, and, in my opinion, early enough. I generally sow in the first week, and have fruit with certainty in April. I have sown early in January, but it involves much trouble for a very precarious gain of a few days in cutting fruit. For those who do not require fruit before the end of May, the beginning of March is a good season at which to sow, and the plants are generally more vigorous, healthy, and continue longer in bearing than those from seed sown in February.

At whatever time the seed is sown the bed ought to be made a week previously; and whilst for February it should be 4 feet high, 3 feet will be sufficiently high in March, and less dung will be needed as the weather becomes warmer. A height of 2 feet 6 inches will be ample for April, one of 2 feet for May, and 1 foot 6 inches from the beginning of June up to September.

I prefer sowing the seed singly in 3-inch pots, half filling the pot with soil, and for drainage placing a lump of turf at the bottom. The compost used should be light turfy loam made fine, and the seed being placed in the centre, cover with half an inch—not more—of fine soil. The soil should be neither very wet nor dry, but in an intermediate condition, and in that case no watering will be needed at sowing, but if the soil is dry it must be made moist. The seeds, before sowing, ought to be proved by putting them in water, and those that swim after two hours' soaking are worthless. Those which sink are good.

If the seed bed be of the proper temperature—80°—to begin with, the pots should be about half plunged; but if it exceed 80° do not plunge them, but set them on the plunging material. When the bottom heat is from 75° to 80° plunge the pots to the rim, as, in consequence of plunging the pots, the heat will be more regular than if it were derived from the atmosphere of the frame. It ought to have been stated before, that the surface of the plunging material ought not to be more than 8 inches from the glass; indeed, when the plants appear, as they will in four or five days, they should not be further from the glass than that—better if not more than 6 inches from it, but they should not be nearer, as the young plants are liable to be chilled if the air in the frame be suddenly cooled by a heavy sudden fall of snow or rain on the glass.

When the seed leaves are as high as the rims of the pots, put soil round the plants up to the level of the rim. The soil used for this purpose should be kept in the frame twenty-four hours previously so as to become warm. Afterwards the plants will not need anything further in the way of soiling or potting until planted out. Some sow three or more seeds in a small pot, and, when the first rough leaf of the seedlings is showing between the seed leaves, pot them off singly, or two in a 3-inch pot. In this case the pots should be so filled with soil that when the plants are put in the pots their seed leaves will be as low as the rim of the pot, and if more than one plant be put in a pot, each should be held in that position, soil being placed round it to within half an inch of the rim or seed leaves. The potting should be done in the frame, and with soil which has been placed there some hours previously to become warm.

The seedlings should be very carefully watered, and always with water of the same temperature as the bed or air of the frame; and though it must not be saturated, the soil must always be kept moist. A gentle watering ought to be given after potting; then plunge the pots in the bed.

The temperature of the frame must be maintained at 65° by night, and from 70° to 75° by day, with a rise of 10° or more from sun heat, taking advantage of warm days to admit air, and yet not in excessive quantity, but sufficient to keep the plants sturdy in habit, and with leaves which will endure sun without flagging or scorching. Air should be given as early in the day after the temperature reaches 75° as can be done without lowering it, and air-giving should cease before the temperature becomes cooled below that.

The bed being the source of heat, it must be frequently examined, and when its temperature is found to be declining, and before it has sunk much, the heat should be renewed by linings of hot dung on one side (the front first), and if it still decline add others all round. The lining should be placed against the side, and may have a base of 18 inches, and be narrowed to 1 foot, keeping it against the side of the frame, and bringing it up to within a few inches of the lights. The temperature of the bed should be ascertained by sinking into it about 1 foot a thermometer, which should indicate a temperature at that depth of 80°; or it may be determined with tolerable accuracy by a stick pushed from the outside under the frame towards the centre of the bed. By withdrawing the stick and feeling it, it may be known when the heat is declining.

It will be necessary a few days after the bed is made, in order to maintain the proper night temperature, to cover the lights at night with mats or other material to prevent the escape of heat, or the air being cooled by the contact of the cold air with the glass. The material should be made secure, so that it may not be blown off by the wind, and it should not be allowed to hang over the sides of the frame, and lie on

the hot dung, as, if the heat or steam from the lining be at all rank, it may pass up under the protecting material, and through the laps of the glass into the frame. The protection should be placed over the lights soon after the sun leaves the frame, or on an average about an hour before dark, and should remain on until an hour after daylight. In some cases putting on dry litter or straw will be sufficient to keep up the temperature of the seed bed. It will be requisite in the case of high winds, which are apt to pass into these small beds and cool them more in proportion than wider hotbeds, that litter should be placed against the side from which the wind is blowing, and, if necessary, all round, placing it also against the sides of the frame to within a few inches of the lights.

The stopping of the plants should be attended to when they have made two joints or rough leaves; then take out their points before the third leaf is formed. This will cause the plants to branch or push shoots from the bases of the leaves, and when these are a few inches long, or have made two leaves, they will be fit for planting-out in the fruiting bed.—G. ABBEY.

VERTICAL CORDON PLUM AND PEAR TREES.

In No. 397, page 340, of this Journal, "T. R.," as well as giving useful hints on cordon trees, has also given an excellent list of Apples suitable for that mode of culture. Will he add to that information by giving a similar list of Pears and Plums for vertical cordons, for open borders (some for walls) are given in page 388), and at the same time state if the trees are to be headed back the same as for espaliers and pyramids; the trees all maiden?—J. M.

[The culture of vertical cordon Plums is rather new here, my bearing trees not being more than six years old. They bear well, and offer a good prospect of success, possibly owing to the calcareous nature of all descriptions of soils in this district. There is no calcareous formation, but all our clays, sands, and loams are full of comminuted chalk, the effect of denudation. The chalk hills to the north-west were doubtless in times long past mountains, the crests of which are now mixed with our soils. This mixture, I apprehend, is the cause of our fruit trees so rapidly coming into a bearing state. I mention this to prevent disappointment, as in some rich deep soils it may not be possible to control the growth of vertical cordon Plum trees by summer-pinching as practised here.

The trees may be planted 4 feet apart, more or less according to circumstances—i. e., the size of the garden. Maiden trees may be planted, and the single shoot they should have must not be shortened. Care, however, should be taken to pinch-in, the first season after planting, all the shoots on the upper part of the tree to one leaf, or two at most; this will tend to make the lower buds break more freely.

The kinds of Plums most amenable to this interesting method of cultivation are the following, but more will be found when more attention is paid to the habits of Plum trees:—Prince Englebert, Belgian Purple, Early Orleans, Early Favourite (Rivers), Cluster Damson, Jefferson, Reine Claude de Bavay, Peach, Belle de Septembre, New Large Bullace, Yellow Magnum Bonum, and Belvoir Plum.

The following kinds of Pears, if on Quince stocks, may be formed into cordons—viz., Baronne de Mello, Beurré Bachelier, Beurré Hardy, Colmar d'Été, Dana's Hovey, Doyenné du Commerce, Fondante d'Automne, Louise Bonne, Madame Treve, Passe Crasanne, St. Michel Archange, Summer Beurré d'Arenberg.

Fruit trees in an English garden require strict attention, like all other objects of fancy, and must be watched accordingly; so that if a tree shows symptoms of over-luxuriance not to be repressed by summer-pinching, two spades should be introduced, as directed in page 340, in treating of cordon Apples, the tree heaved, so as to break off a portion of its roots, and the earth trodden down round it. If this fail root-pruning should be had recourse to; and if over-luxuriance is still in the ascendant, the tree may be lifted—taken up with its roots intact—and replanted. Some trees may require only a gentle heaving, others a slight root-pruning on one side, and others the more rigid treatment of lifting. In no case should the fruit-culturist be an R. R.—a rash remover, like my excellent and acute friend "C. C. E." Does the poultry-fancier suffer his pets to ramble about for months without care and attention? Does the shorthorn-breeder suffer his beautiful heifers to be turned on to a common with the eastermonger's donkey, which is always seeking and not finding? I think not. We must

therefore imitate our poultry and shorthorn prize-seekers and pay strict attention to our garden fruit trees, "root and branch."

I have known and advocated root-pruning for forty years; but I was not the originator of the system, for, like all inventions of consequence, it cast its shadow before in the shape of hints and notes from the correspondents of our horticultural periodicals. It is only recently that it has been formed into a system which, even at present, is but imperfectly understood, but which is making progress, so that a day will arrive when our gardeners will scarcely believe that "once upon a time" the roots of our garden fruit trees rambled uncontrolled by the pruner.—T. RIVERS.]

MANLEY HALL, STRET福德, MANCHESTER.

THE RESIDENCE OF SAM MENDEL, ESQ.

(Continued from page 338.)

On leaving the Erica house I entered the house that was originally the Pine stove, but it is now converted into a house for specimen stove plants, and is, perhaps, one of the finest for this purpose to be found in the kingdom. It is 69 by 28 feet, has a pit in the centre 15 feet 8 inches wide, and a 3-feet-4-inch walk all round; between the walk and the sides of the house is a stage 2 feet 6 inches wide, made of solid slabs of iron covered with Derbyshire spar, and supported by stout iron pillars. This is at once the neatest and most substantial stage I have ever seen. The pit is formed of brick walls having a coping of dressed stone, and is filled up to within 6 inches of the top of the coping with tan, on which are placed some magnificent specimens of stove plants. Directly facing the door at the east end is a splendid *Croton variegatum* 7 feet high and 5 feet through, and most beautifully coloured—a perfect pillar of gold. There were also a *Croton angustifolium*, of larger dimensions than the plant just noticed, a grand *Medinilla magnifica*, and specimens of the following plants, most of which are considerably larger than those of which the dimensions are given above—viz., *Croton pictum*, *Rhynchosia albonitens*, *Cissus discolor*, *Dracæna ferrea*, *Cossinea borbonica*, *Pandanus elegantissimus*, in the most perfect health and vigour, *Rondeletia speciosa*, showing hundreds of trusses of orange and red flowers, and *Eurya latifolia variegata*, with handsome Camellia-like foliage. This plant, Mr. Petch tells me, is quite hardy; if this be so, it will most certainly become one of the most popular bedding plants of the day, for no foliage can be more beautifully variegated, and as a decorative plant for the conservatory or greenhouse it has few equals. There were, besides, beautiful plants of *Gesneras* in great variety, *Dracæna Cooperi* and *stricta*, with very large leaves brilliantly coloured, and *Ananas Porteus*, the beautiful new Pine Apple sent out in 1866; likewise some of the new *Celestines*, forming handsome pyramids. The best were *C. Bansei*, *C. Barkleyi* and *C. Saundersi*; to these Mr. Petch must add *C. Marshalli* and *C. Telfordi aurea*, the latter the handsomest of the whole. They are fine for conservatory decoration in the summer, and their colours may be kept very bright throughout the winter months if the plants are placed in the warmest and lightest part of the conservatory. In addition to the plants already mentioned, there were finely coloured specimens of *Dracæna marginata*, the best of the *Dracænas*, and *Begonia Pearcei*, one of the handsomest of winter-flowering plants with beautiful foliage, and which will be a lasting *souvenir* of poor Pearce.

This house is about 13 feet from floor to roof, and has a division in the centre. In the second compartment of the house there are fine specimens of many stove plants, and among them a plant of *Allamanda nobilis*, 7 or 8 feet high. Of what the appearance of this grand plant will be when it is covered with its immense large bright yellow flowers, those only who have seen it can form any idea. There were also fine plants of *Allamanda Schottii* and *Hendersoni*, *Gardenia florida*, *Dipladenia amabilis*, and the grand old *Combretum purpureum*, a plant not half so extensively cultivated as it ought to be. Here also were several varieties of the Cotton plant in various stages; some were just bursting their pods, and showing what is the source of the great wealth of Manchester. Some large plants of *Ixoras* were in a fine state of health, and were shortly to be placed in a new stove which has been specially erected for them.

I next entered a fine new span-roofed house, in three divisions, of the same length as the last, and 19 feet 6 inches wide.

It, too, has a pit in the centre, and what I call the everlasting side shelves covered with Derbyshire spar.

The eastern division is devoted to ornamental-foliaged greenhouse plants, and contained some very promising specimens of *Phormium tenax variegatum* (the variegated New Zealand Flax), a splendid pair of the beautiful and very rare *Yucca albo-spica*, a handsome pair of *Aralia Sieboldi variegata*, and several of the Australian *Dracanas* and *Cordylines*, *C. Macarthurii* being very conspicuous.

The second division is called the *Ixora* house, having been constructed expressly for the cultivation of plants of that genus; and the third or west division, the *Allsands* house, being intended for *Allamandas* and *Dipladenias*. On each side of this house is a very useful pit, which, like most of those attached to the houses, is heated by hot water. Such pits are invaluable for stowing away large numbers of plants, and for the encouragement of young specimens.

The three Orchid houses in this block, together with the two magnificent ferneries on the east side of the grounds, being under the management of Mr. W. Milford, I pass over their contents at present.—J. WILLS, F.R.H.S.

(To be continued.)

GARDENING IN THE WEST.—No. 2.

THE most important difference between the climate of Great Britain at large and that of the middle States of America (lat. 40° to 43°), is not the most obvious to the senses. The intensities of temperature are strikingly apparent, but the frequent extreme dryness of the air, if more obscure, is perhaps on that account all the more powerful and hurtful. What we do not see or feel we do not readily suspect. Even Dr. Franklin, eminently close observer of natural phenomena as he was, does not seem to have had his attention drawn to this feature of the American climate until the inquiry arose in his mind, What influence caused some wooden drawers that were made in England, and fitted very tightly there, to be quite loose in Philadelphia?

This want of vapour in the air is perhaps as common in winter as in summer, and greatest among the mountains of the Alleghany range, and away from the influence of the great lakes, &c. In the summer there are terms of tropical heat, and the air licks up with avidity every drop of moisture which it can reach. It will be remembered how greatly the capacity of air for vapour increases as its temperature rises. I have sometimes observed how long my hands would remain wet when simply held in the air after washing: in two minutes every trace of moisture has disappeared. The escaping steam from engines within view affords a very good indication of the degree of aerial thirst. In parching weather the steam escaping from a locomotive vanishes as instantaneously as from a tea-kettle in the heated air of a chimney. Usually the air is extremely clear and bright when so drained of vapour, but sometimes a smoky haze attends it.

In winter and early in spring strong north-west winds suddenly sweep the sky as with a broom. All fog and haze disappear, leaving a beautiful but dazzling brightness. These winds dry themselves on their way over sheets of snow that cover more than half the continent, and when they reach the icy crests of the Alleghanies they leave condensed upon them the last drops of their moisture. Being somewhat warmed while passing through the sunny valleys on the south and east of the mountains, these winds again derive moisture from the ice itself. In these valleys, probably, the extremes of hygrometrical variations occur. When the south and east winds come they are loaded with vapour from the Gulf Stream off the coast, and this is freely deposited among the cool mountains. Such visitations are not frequent. They are very uncommon in the summer, when thousands of cultivators would welcome their genial influences.

Under the influences of these rough, vapourless north-westers, the native vegetation on open dry plains is, of course, very different from what is found near open water, and especially in the lee of the great lakes. The open dry plateaus east of the mountains used to be called "barrens;" they had the appearance of sterility, and were avoided by settlers as worthless. Only the very hardiest and most rugged trees grew on them; Scrub or Chinquapin Oaks, and dwarf Pines, growing slowly, because continually pinched by the abstraction of moisture from their leaves and stems. It was found, however, that the soil of these plateaus had far greater capabilities than was supposed, and they are now among the best grain-growing dis-

tricts in the country. Red Clover serves for grass, there being no permanent meadows. Deep culture, to secure a supply of moisture for the roots, gives glorious crops of Indian Corn and of vegetables; while Wheat, although hurried so as to have little more than four months of actual growth, wants but a screen of snow through the winter and the opening of spring to ripen bountifully, in the first week of July, superior grain. If, however, neglectful culture, or injury from climate or insect, makes the ripening later than about July 10, the blades and stems of the plant rust, and the crop succumbs under the fierce temperature of the summer.

A notable change in the climate of the middle States has been observed since the north-western States have been settled. Peach and Quince trees, and other trees and shrubs of tender constitution, now fail to bear fruit, or even to live, where once they flourished. In those early days the western winds prevailed as they do now, but they were supplied with moisture, and softened by passing through and over almost boundless forests.

The advantage of a sheltering belt of leafy trees on the north and west sides of fields and buildings is very great. Farms so situated are valued by good judges at 25 per cent. more than land of the same description on the open unsheltered plain, where every March the attacks of the ann and the wind are renewed; for there the sun has at that time an equal altitude to that of our "English sun" in June and July, and it has greater power. At the same time keen northern blasts often drive over the district, continuing one, two, three days, or even more, and carrying into every cranny a temperature often below zero. If the wind and sun strip off the mantle of snow from the Wheat fields, the Strawberry beds, or the Clover fields, the unprotected plants perish under the alternate charges of heat and cold.

It is one duty of the gardener to teach the planting of sheltering belts. The American is disinclined to begin to do what he has laboured so hard and so long to undo. He has been bred to the duty of killing off and clearing all native growth; he prides himself on the complete absence of sprouts or shoots from his fields. Very often there is not a shading tree to screen the reapers at their lunch, or the cattle at their siesta. The fences of dead rails are no protection.

The glorious sun eventually conquers, and wonderfully repairs and beautifies the scene for summer. As walls are required in England to retain and accumulate sun heat, trees are wanted in America to divide, moisten, and soften the drying blasts.

Good illustrations of the genial effect of foliage on the air are supplied by the native Grape Vines, which never appear so healthy, or bear fair fruit so abundantly, as when their foliage is intermingled with that of some luxuriant tree, and bathed continually in the moisture of its exhalations. The thin leaves of young Pear trees often endure, and feed the stem that carries them the season through, if sheltered closely by some more robust nurse tree; while similar plants standing out separately lose their leaves in July, and become poor, feeble, and consumptive. Peach trees among the thick, damp Pine forests of the western slope of the Alleghany mountains, are healthier and more productive in a temperature which often sinks to 20° below zero, and in cold wet soil, than they are in the open valleys eastward, where the warmth of both the air and the soil are much greater, and where every condition is more favourable, excepting the frequent atmospheric dryness. So Gooseberries, which almost uniformly perish with mildew in open clear culture, often ripen fair fruit among weeds or grass. Even the native forest trees do not endure the strain if their fellows are cut away, and the tall bare stem of the solitary tree is fully exposed. Unless shoots issue to clothe the stem with foliage the tree soon begins to decay at the summit, and eventually perishes.

In another article some of the means used, out of doors and in, to avoid the evils and secure the good of this feature of the American climate will be noticed.—PENNSYLVANIA.

THE ROYAL ASCOT GRAPE.

IN answer to the letter which appeared in your number published on the 3rd inst., from Mr. Thomas Record, relative to the keeping qualities of the Royal Ascot Grape, we have to state that as yet no one but ourselves has had the opportunity of testing its merits in this particular point. From our own experience, however, we have no hesitation in stating that it

will hang quite as long as the Alicante or Lady Downe's; besides which it is in flavour very superior to either of them. Even under the most adverse circumstances it sets more freely than any other sort we know, and the same remarks will apply to the crops which it carries.

To show what can be done with this Vine, we would mention that on the 28th of May last we planted one of our largest houses with canes raised from cuttings since February this year. They are now carrying a fair crop of fine fruit, which will be ripe by the 1st of January, and will hang well until April. If Mr. Record will favour us with a visit in January, and taste them, we do not think he will care for the fruit of Lady Downe's (for the three winter months) afterwards.—JOHN STANDISH AND Co., Royal Nurseries, Ascot.

GROWING FRUIT FOR MARKET AT LITTLE SUTTON, CHISWICK.

MR. DANCER'S.

(Continued from page 397.)

I now come to a well-known and deservedly popular Plum—viz., Denyer's Victoria. It is of large size, and in shape oval; the skin reddish purple; the flesh yellow, sweet, and pleasantly flavoured, parting freely from the stone. When well ripened it is good for dessert, but its merits lie in its culinary qualities. Good though it undoubtedly is, it is not a London Plum, although sold largely in Covent Garden, and cultivated extensively in the neighbourhood of London. It is but very little used there, the whole stock of it being greedily bought up for the use of the cotton-spinners of Manchester and the iron-workers of Glasgow. The Victoria is not a very profitable variety to cultivate, although a prolific and tolerably constant bearer; some seasons, indeed, the trees bear to such excess that many of the fruits never come to perfection, and the tree is injured so much by this over-exertion, that it frequently takes years to recover. The tree is of drooping habit, and never attains a very large size.

Poupart's Plum is a true market gardeners' Plum, little known elsewhere. It is named after Mr. Poupart, a large market gardener, who grew it extensively. Mr. Dancer has a good many trees of this sort, and recommends it highly, forming, as it does, a good succession to the earlier sorts. It is an excellent cropper, and, the fruit being rather firm, it can be carried in excellent condition to market—a quality which is a great recommendation. The fruit, which is nearly round, very much resembles in appearance Reine Claude Violette. The colour is light purple, dotted and streaked with yellow; the flesh reddish, sweet, but with a smack of the slye flavour. An excellent preserving variety, and generally commanding a good price in Covent Garden. There is one peculiarity attached to this Plum. It is this: The trees bear fruit very irregularly. The whole of the plant may be well covered with flowers in spring, yet the fruit is borne on only a portion of the tree, some branches being literally loaded, and, to use a common expression, hanging "as thick as repes of onions;" while other branches, having exactly the same appearance, are entirely destitute of fruit. This is a general characteristic of the variety. I have examined scores of trees in Mr. Dancer's and other gardens, and they are all so. I never saw any Plum produce the fruit in such enormous clusters; so thickly packed together are they, that Mr. Dancer compares the little branches thus laden to bottle brushes. It is but a moderate grower.

Cooper's Large, or La Delicieuse, is a very strong-growing sort, one of the few Plums which form timber trees. It is a rather large, oval, purplish Plum, sometimes, when not over-cropped, of excellent flavour. It is, however, by no means a good sort for cultivation, for the tree, having very large leaves, suffers severely in dry seasons, and the whole crop, which is very abundantly produced, is rendered worthless. The fruit, likewise, being of a dull colour, brings a very poor price in the market. Sandalls Plum, as a late variety coming into use in September, or after all the others are over, is very desirable. Mr. Dancer calls it a "really good Plum." The fruit is of medium size, oval, dark purplish. The tree is but a moderate bearer. The fruit, after being ripe, hangs a long time on the tree without cracking; and as but few Plums will do so, it is on this account, as well as its lateness, much to be recommended. It takes well in the market. The tree grows to a great size—from 30 to 40 feet, and, like La Delicieuse, is one of the few Plums which form timber. Mr. Dancer cultivates it extensively.

Of Plums which Mr. Dancer has on trial, and which promise to prove good marketable and profitable sorts, I may mention the following. When I say "on trial," I do not mean one or two small lots of trees as usually the practice, I speak of hundreds. Yes, the new varieties are tried by the hundred, if to be procured, and if unsuitable they have only to be grafted again. They are—Belle de Septembre, an excellent late purple sort, a vigorous upright grower; in use in the end of September. Autumn Compôte, also a reddish purple Plum, coming into late use. Belgian Purple, a very promising sort, large, and of excellent quality; midseason. Prince Englebert, a very excellent Plum, a prodigious bearer, somewhat resembling, but larger and of better flavour than Mitchelson's. Rivers's Early Prolific, a valuable early Plum, ripening in the end of July. With Mr. Rivers, this Plum bears most enormously, and makes but little wood. With Mr. Dancer, again, it has as yet, borne but very thinly, but grows excessively, making sheets from 3 to 4 feet in length during the season.

There are some other sorts of Plums which have been, or still are, slightly cultivated by Mr. Dancer, but which have proved unsuitable, either as to their bearing properties or market popularity. Such are Washington, which is not only a bad bearer in general, but on account of its colour and softness it will not sell. Jefferson is a great bearer. It is, however, a slight clingstone, and on that account avoided by the market folks. Kirke's, very beautiful in appearance, but a bad bearer, and in general commanding but a low price. Pond's Seedling, large, but, like Denyer's Victoria, not a London Plum. Green Gages, of which there are several sub-varieties—these are the queens of Plums as regards flavour, but being shy bearers, and the half-ripe fruit being so very liable to crack and split with a little wet, the whole crop is frequently destroyed. The Green Gage is not by any means a profitable variety to cultivate.

I have now noticed the Plums Mr. Dancer cultivates, and which have been proved to be the best suited for his particular district and soil—a deep alluvial loam, with gravelly subsoil. Of this, however, more hereafter. These are the Plums, which, although not perhaps the finest in quality, yet produce the largest and most constant crops, and find the most ready sale in the market. They are, consequently, the most profitable varieties to cultivate for market purposes, or for any other purpose where quantity, not quality, as dessert fruit is desired. The Plums, it may be noted, which find so ready a sale are almost always good culinary sorts, that being the chief purpose for which they are purchased. In other districts and other soils a few other varieties may, perhaps, be found equally well suited, or, again, these varieties in other soils and localities may not be found so desirable, not to speak of different methods of culture, which I shall not enter upon here, but leave for another paper. There are no sorts, however, which find a more ready sale in Covent Garden.

To make it quite clear which varieties I have been alluding to in this and the previous paper, I again enumerate them, and class them according to their season of ripening.

1st, Plums cultivated largely by Mr. Dancer and highly recommended.

VINES OUT OF DOORS.

In your number of December 3rd I read with much pleasure an article entitled "Out-of-doors Grapes" by your correspondent "ARCHAMBAUD," and his estimate of the different sorts of Grapes was useful and very interesting. He says that it was to discover which of the many varieties was most suited to open-air cultivation that Mr. Kemp offered his prizes at the Horticultural Society's Fruit Committee Meeting in October. Out-door growers will thank Mr. Kemp heartily, and your correspondent for giving them the result; but it appears to me that it should not stop here. Having decided which is the best sort to grow, the next thing is to teach people how to grow it; for there is not one amateur gardener in a hundred who has the most remote idea of the best method of cultivation.

and I regret to say that professional gardeners as a rule are inclined to snub the matter altogether, as something below their dignity, and if called on to dress a Vine, do it, certainly, though not *con amore*, but rather in a well-if-I-must-I-must sort of way, and as they would their Vines under glass.

Is there none of your numerous and able contributors who will condescend to lay down the system best adapted for producing good and well-ripened Grapes, not in a season such as the last merely, but in four seasons out of five? Is there no second Hoare will arise to point out to the thoughtless the folly of allowing a dozen bearing rods to remain on a Vine out of doors, when if they made use of their eyes they would find one or two only left on those grown under more favourable circumstances under glass, and that they had better take a lesson out of their own books in their treatment of their Raspberries, and cut out the long rods that have borne fruit, and leave the new ones that have been growing during the time?

"ARCHAMBAUD" advocates the cultivation of the Vine it is true, but he is a very lukewarm advocate, and holds out but little hope of success or satisfaction from it. He appears to think that one can only aspire to the production of a "tolerably decent lot of Grapes" which can be obtained by a "little ordinary attention," but I should like to see some one teach us to aspire to much more than this, as I must maintain that with a little extraordinary attention, certain success and great satisfaction will be obtained.

I am an old disciple of Hoare of five-and-twenty years' standing, and some years ago was complimented by you for Grapes which I was bold enough to send for your opinion. The white Grapes everyone can ripen, but as a rule I ripen the Black Hamburg, although, I confess, not with what would be called "ordinary attention," for I bestow almost as much time on the stopping of the shoots, the removal of laterals, and the thinning of the berries as would any gardener in his vinery; but what a pleasant occupation! and how suited for ladies if they would but take a little trouble to acquire a knowledge of what is to be done. This year is, of course, exceptional, but I have been told by many of my friends that they have tasted no sweeter or finer-flavoured fruit than mine, whether grown in greenhouse, hothouse, or otherwise. I allowed some of the rods to remain on the Vine, covered with nets to protect them from birds, until ten days ago, when I cut them clean down, with the bunches attached, and I hope to have a few dishes for dessert during the Christmas week.

I hope that some one of your able correspondents will take this matter up.—H. S. WATSON, *Old Charlton*.

[We quite agree with our correspondent in thinking that the subject of ripening Grapes on open walls is deserving of more attention. Mr. Weaver, gardener to the Warden of Winchester College, ripens Black Hamburgs without any protection against the walls of his garden in Winchester. We wish that he, and any other of our readers who has been successful in this practice, would send us full details of their modes and times of pruning, &c. Why should not our present correspondent relate his successful mode of culture?—EWS.]

ROYAL HORTICULTURAL SOCIETY.

DECEMBER 15TH.

FRUIT COMMITTEE.—G. F. Wilson, Esq., in the chair. The list of the Committee was revised, and Mr. Rose, of Frogmore, Mr. Beale (Messrs. Carter & Co.), and Mr. Fean, of the Rectory, Woodstock, were elected. A letter was read from Rev. George Kemp, offering two prizes of £3 and £2 for out-door Grapes grown in the open air against a wall without any protection whatever. Mr. Melville, of Dalmeny Park, sent plants of his new shrubby variegated Kale, which he obtained by crossing the old perennial Woburn Kale with the varieties of the biennial which he has grown for some years, his object being to obtain a variegated Kale of a shrubby character for the decoration of shrubberies in winter. By a prosecution of these experiments there is every appearance that Mr. Melville will succeed in his laudable object. Mr. Lee, of Clevedon, near Bristol, sent a noble head of Cauliflower raised from plants which stood the severe winter of 1866-67, and it received a special certificate. Messrs. Cutbush and Son, of Highgate, sent specimens of Cutbush's Crimson Beet. Mr. Earley exhibited good specimens of Williams' Improved Matchless Celery, which was considered similar to Cole's Defiance. Mr. Earley also sent dishes of very handsome Mushrooms and of forced Sea-kale, which received a special certificate. He also exhibited a very fine dish of Bergamotte Esperen Pear, Fearu's Pippin, Cockle Pippin, and Sam Young, as well as a fine dish of Tangierine Oranges, which also received a special certificate. Mrs. Allen, of Notting Hill, sent a dish of the Crown or Mommy Pear.

Mr. Whiting, of the Deepdene, showed a bunch of a Black Grape

from Italy, grown at Bury Hill. It is of an oval shape, with a dense blue bloom, and agreeable flavour. He also exhibited dishes of very handsome Alfreton and Small's Admirable Apples, and Bergamotte Esperen and Dr. Bretonneau Pears, all of which were in good condition, and received a special certificate. Mr. Rivers, of Sawbridge-worth, sent a collection of Oranges grown in 10-inch pots, standing on slates on two hot-water pipes, the pots plunged in cocoa-nut fibre, the heat constant and gentle. The trees blossomed in February and March. Since October the air of the house has been heated to 60° and 65° by two 4-inch surface pipes. The varieties were Bittancourt, Maltese Blood, Sustain, and two varieties of St. Michael's. To this collection a special certificate was awarded. Mr. Forsyth, of Gannabury, sent a large fruit of Smooth-leaved Cayenne Pine Apple, which received a special certificate. Mr. Jennings, of Shipston-on-Soar, sent a small seedling Apple, raised from Siberian Crab. Mr. Haines, of Rotherby Hall, Leicester, sent specimens of Bess Pool Apple, from a tree grafted on the Crab stock, and others from a tree double-grafted on a Pearmain. The effect of this double-grafting was to enlarge the fruit to nearly double the size of that grown on the Crab. Mr. Gilbert, gardener to the Marquis of Exeter, sent specimens of Lord Burghley Apple of very excellent quality, also a seedling kitchen Apple. Mr. Cox, of Rudlake, sent a dish of Winter Nelis Pear, grafted on the Chaumontel, the fruit of which partook of the flavour and character of both. Mr. Mair, of Oulton Park, sent specimens of Oulton Park Russet Apple, which was considered inferior in flavour. Mr. W. G. Pragnell, gardener to G. W. Digby, Esq., Castle Garden, Sherborne, sent a White Celery, which proved of very poor flavour, inferior to others in cultivation.

FLORAL COMMITTEE.—This was the last meeting of the season, and by no means an uninteresting one. The Orchids were as good as in the summer months, though not quite so numerous. Mr. J. Hodges, gardener to E. Wright, Esq., exhibited a cut specimen of a variety of *Oncidium macranthum*; and Mr. C. Garland, gardener to Sir T. D. Acland, cut specimens of *Camellia Imbricata*, with white stripes, not an uncommon occurrence. Mr. C. Osman, gardener to R. Holland, Esq., Stanmore Hall, sent a cut specimen of *Dahlia imperialis*; a special certificate was awarded to it. Mr. J. Davidson, gardener to R. Ralli, Esq., Putney Heath, exhibited a small specimen of the same plant. Messrs. Veitch, of Chelsea, sent a fine collection of Orchids, among which were *Masdevallia candida*—first class certificate; *Lælia alba rosea*, a very pretty Orchid, *Decadrobium Fitchianum* (?)—second-class certificate; *Pleione humile*—first-class; *Pteris cretica albo-lineata angusta*—first-class; *Mormodes Skinneri*, and several others. A special certificate was awarded for the collection. Mr. Tanton brought cut specimens of his *Allamanda Wardleiana*, to prove its continuity of winter-blooming. Mr. A. Henderson, Pine-Apple Place, exhibited *Agnostus integrifolius*.

Mr. Weatherill, Finchley, exhibited a collection of his hybrid Solanums, the plants well covered with fruit, and many of them very showy and handsome; one was called *rebutum*, but not sufficiently differing from the named sorts of last year. A special certificate was awarded the collection. From the same exhibitor came also *Primula sinensis* Wonderful, a very large-flowering purplish white seedling, very distinct; this received a first-class certificate. Mr. Ball exhibited three varieties of *Dammara*. D. Moorei had received a first-class certificate; D. hypoleuca and robusta were not so good; *Bignonia erecta multiflora*; three small plants of *Begonia sagittata*, with beautiful spotted foliage, and B. foliosa, a useful plant for hanging-baskets. It was requested that the latter two should be sent again. The same exhibitor had in addition *Odontoglossum cristatum*; *Geonoma Seemannii*, a very handsome Palm—first-class certificate; *Psychosperma lacera*, another Palm—the plants too young to show their merit, requested to be seen again; *Richardia melanoleuca*, a curious form of Aroid with a small scape and dark centre—second-class certificate; a small seedling plant of *Alsophila atrovirens*, to be seen again.

Dr. Rogers, East Grinstead, sent a new species of *Oncidium*, named by the Rev. M. J. Berkeley *Oncidium Rogersii*, the largest and finest of its race, with beautiful large yellow flowers. Mr. Williams, of Holloway, received a special certificate for a large collection of Solanums, containing Mr. Weatherill's best seedlings of last year, and two fine Orchids, *Angraecum pellucidum* and A. chinensis. A special certificate was awarded them. Mr. Pilcher, gardener to S. Racker, Esq., exhibited two splendid specimens of Orchids, each of which received a special certificate—namely, *Epidendrum vitellinum*, with bright scarlet flowers, and *Lælia autumnalis*, very lovely.

Mr. Allea, gardener to Capt. Glegg, sent a box of cut Camellias and Roses. Among the Camellias was one exhibited last year, named after Miss Glegg, a very beautiful scarlet and white flower. The whole collection contained many good flowers. A special certificate was awarded. W. Marshall, Esq., brought a specimen of *Hemanthus*, which was found to be H. tenniflorus. Mr. Parker, Tooting, brought a specimen of *Ixora amabilis*, which had received a first-class certificate. There was also a very good collection of Orchids from the Society's gardens, containing *Cypripedium* and *Lycaste Skinneri*.

GENERAL MEETING.—James Bateman, Esq., F.R.S., in the chair. After the election of nine new Fellows, and the admission of the West Carbury Agricultural Society into union, the Committee awards were reported. The Rev. Joshua Dix next exhibited some artificial flowers manufactured by Mr. T. Robinson, which, though presenting a dried-up appearance, when dipped for a moment in water and then withdrawn,

expand and resemble natural flowers, like which they are variously scented.

The Rev. M. J. Berkeley then addressed the meeting, remarking that by far the most interesting part of the plants exhibited consisted of Orchids, but these, as Mr. Bateman was present, he would pass over. With reference to *Dahlia imperialis*, a small portion of a plant of which was exhibited by Mr. Osman, gardener to R. Holland, Esq., of Stanmore Hall, he might mention that the tubers which Mr. Bateman had communicated to the Society last year had germinated beautifully, but the buds did not come to perfection owing to the insufficient amount of heat given. Next year, however, more heat would be afforded, and the successful flowering of the plant might consequently be expected. The *Hemanthus* exhibited by Mr. Marshall was next referred to, and Mr. Berkeley said he had no doubt that it was the true *Hemanthus tenuiflorus*, a variety of which was figured many years ago in the "Botanical Magazine." *Stenocarpus Cunninghamii* was then noticed, and it was remarked that in the tertiary deposits leaves had been found very closely resembling those of the *Stenocarpus*, and therefore the notion had been mooted that the vegetation of the south of Europe at the period of the tertiary formation was similar to that of Australia at the present day. *Richardia melanoleuca* was the next plant to which attention was directed, and it was remarked that it was drawn up, probably, from having received more heat than it required, and that, grown in a cooler temperature, it would most likely have a very fine appearance. The large collection of Gourds exhibited by Messrs. Barr & Sagden at the last meeting, and which still remained in the room, was the next subject to which attention was drawn. Mr. Berkeley remarking that all the varying forms were referable to two types—namely, the varieties with the angular, deeply grooved stems to *Cucurbita Pepo*, and the large kinds to *Cucurbita maxima*. In addition to these two species there were two others, though not exhibited—namely, the *Portemanteau* Gourd, *C. moschata*, which, if our climate were warm enough, would completely supersede the Vegetable Marrow; and *C. melanosperma*, with black seeds. *Cissas discolor*, of which some flowering shoots came from the Society's Garden at Chiswick, was next noticed; and Mr. Berkeley observed that a whole houseful of it was there in flower, the inflorescence having a delicate fragrance. The reason it did not produce its inflorescence generally in this country was, probably, that it was treated too much as a greenhouse plant. An extremely curious Fungus, from Mr. Besch, gardener at Castle Ashby, Mr. Berkeley considered to be an entirely new species; and in connection with this subject he mentioned that he had received a communication from the Cape of Good Hope relative to a Fungus which had attacked the Pelargoniums there, and it was feared their cultivation would have to be given up. Now, though the common wild Geraniums were attacked in this country by rust or Uredo, he had never heard of Pelargoniums being affected by it; but the matter was of great importance, for it had been proposed to employ the Cape species for the purpose of hybridising and obtaining new varieties, and it would be a great misfortune—indeed, one of the greatest he could conceive—to gardeners, were such a result as that apprehended at the Cape to occur in this country. He therefore strongly advised that the imported plants should be watched, and if any showed signs of the disease they ought to be committed to the flames. The Oidium of the Vine and the Potato mould were, in all probability, introduced into this country from abroad, and everyone knew what disastrous results. He had likewise received from Dr. Anderson, of the Calcutta Botanic Garden, a sample of Assam Tea said to be attacked by a parasitic growth, but he (Mr. Berkeley) could detect none. Still, it was known that in many cases Fungi were not fully developed till the leaves had fallen from the tree. At any rate, the tea made from the leaves was very bad-tasted, much worse than Mr. Bateman's Orchid Tea. Another sample of Tea leaves which he had received along with that just noticed appeared to be merely covered with smut consequent on the saccharine depositions of an aphid. He might mention, while on this subject, a disease of great consequence in Australia, known there as the "red rust." This was the infant state of the common Wheat mildew. There was yet another disease, known as "take all," but he had not sufficient evidence to say what it is. Those, however, who are acquainted with Australia had informed him that the rotation of crops was not practised, and that year after year Wheat was grown on the same land without intermission, and eventually the soil became exhausted, little but silica being left. Failure under such circumstances could not be wondered at.

Mr. Bateman observed, that before proceeding to notice the Orchids he would refer to the magnificent Oranges exhibited by Mr. Rivers who, not content with growing Apples, Pears, and similar fruits in the orchard house, had started the idea of a tropical orchard house. He (Mr. Bateman), had determined to attempt this mode of cultivation, and had fitted up a compartment of a house, and, though he had had beautiful Tangerine Oranges, he fortunately failed. He said fortunately, for he had found out that this division exactly suited the Mexican Orchids, which require to be kept cooler and drier than those from the East Indies. Till this important point in Orchid cultivation was discovered he had never had the pleasure of introducing to an English audience such a plant of *Lalia autumnalis* as that from Mr. Rucker's gardener. Two or three flowers were all that could be produced. He found the plant growing at Mr. Rucker's in a large, airy, warm greenhouse. It was called in Mexico *Flor de los Santos*, and is much used in the decoration of the churches at festival times. He

also found at Mr. Rucker's the *Epidendrum vitellinum*, which accompanied his magnificent *Lalia*. He (Mr. Bateman) had felt some doubt as to whether there was or was not a major variety of that plant, but it was now set at rest, for large as the flowers were in Mr. Rucker's specimen they were not so large as in some plants introduced by Messrs. Low. In the last number of the "Botanical Magazine" was figured what was supposed to be the largest-flowered of all the *Oncidiums*, *O. macranthum*, but it would seem as if there were a fate that as soon as we had named one thing on account of its superior size, there was sure to be something to beat it. It was thought that *Oncidium macranthum*, which was exhibited at one of the Society's meetings by Lord Londesborough's gardener, Mr. Richards, was the largest in existence, but now, on the last day of the season, he (Mr. Bateman) had the pleasure of introducing one very much larger, in the new species worthily named after Dr. Rogers. It came from a very high and very cool part of Brazil, and would, no doubt, take its station among the Mexican Orchids. Whether, however, it were a variety of *Oncidium bifolium*, bearing the relation of Ching to Chang, remained to be seen. Specimens of *Cypripedium candatum* and *Angraecum sesquipedale*, were next pointed out as good, but of the latter the tail-like appendage was not so long as was sometimes seen. This plant, it was also remarked, should have the warmest position in the Orchid house.

Mr. Bateman then observed, with reference to *Dahlia imperialis*, that he had seen it in Mr. Woolfield's garden at Cannes last year, and had had the honour of introducing it to the notice of a meeting of the Society, exhibiting, at the same time, dried specimens of the flowers, which he again produced; but now they had the fresh flowers, though he was sorry to say, the Society's tubers had only produced buds. He would now leave the living flowers, and turn to flowers of another description—the artificial ones for Christmas decoration sent by Mr. Goodman, who had had the good fortune to secure the favourable notice of two of the leading church papers of opposite views—the only instance he ever knew of their agreeing. No one could fail to admire the Variegated Holly and some other things, but, on the other hand, there were productions which resembled nothing in nature, and he would recommend her as a copy for Mr. Goodman's future efforts. Living, said Mr. Bateman, 150 miles from London, he always received numerous applications for evergreens at Christmas for the decoration of churches, &c.; but about London, the demand was so great and the supply so small, that many persons had to put a guard over their evergreens lest they should be stolen. He thought, then, that these artificial decorations of flowers and foliage would be something in the interests of horticulture, or rather arboriculture.

Mr. Bateman, in his concluding remarks, said that he only hoped that in the coming year as much interest would be taken, and as much progress made, in horticulture as in that now passing away; and he was agreeably surprised to find that the meetings were so well attended at this dull season. He only wished that during the year more new Orchids had been introduced, but this was partly owing to two grievous losses—that of Mr. Wilson Saunders's collector, Mr. Bowman, who died when about to come home with a valuable collection; the other loss being that of Mr. Pearce. These were great drawbacks, but the Orchid mania must be fed with fresh fuel, and of such there was plenty waiting only to be conquered by the indomitable spirit and pluck of collectors. In accordance with an old Tipton Street custom, which had been revived, he had to announce for distribution among those present the flowers of *Chimonanthus grandiflorus* from Chiswick, and, he would venture to add, Mr. Rivers's Oranges.

The next meeting will take place on the 19th of January.

A FEW WORDS TO GARDENERS ON EMIGRATION.

I, for one, hailed with exceedingly great pleasure the brief article in the Journal entitled "Gardening in the Far West," and also look forward with feelings of anticipated pleasure to the others promised by your correspondent "PENNSYLVANIA." I myself, after years of intimate knowledge of gardeners and gardening, have often thought that if gardeners could be induced to emigrate to some such land as Canada or the Western States of America, a substantial future in most cases would be in store for them. I know it would require a strong effort of determination on their parts, also great self-denial for some years in a new and strange land; but, in the majority of cases, the reward would amply repay any temporary inconvenience that would have to be endured by the energetic, intelligent, and mostly highly educated men before whom I desire, by your help, to lay these few and feeble words.

In the first place, I have a sad knowledge, a knowledge that has come close home to myself, that gardeners are far too numerous, and, at a modest but rough estimate, there are always from 800 to 1000 really good, capable, and able gardeners out of situations—men of unblemished characters, of high professional reputation, and capable, by their acquirements, of conducting the largest places in the kingdom in a proper and scientific manner. Anyone, too, who knows anything at all about the matter, knows that yearly a vast number of

clever young men are leaving our great places to seek for head gardeners' situations, thus swelling the number already too great.

I do not suppose that one gardener throughout the land would deny but that there are too many gardeners by one-half, and I think, looking to the matter in all its bearings, nothing holds out such an independent future as leaving this crowded country for the rich virgin lands of the West, which only await willing hands and rightly directed energies to return substance and plenty, and that which is to be as highly prized, personal independence, and the sweet and restful knowledge that our children may the more surely and easily obtain that competence and independence which they can never obtain in Britain, enter into the struggle keenly as they may, carry with them as high abilities as possible, and let their determination to succeed be as strong as need be; and this for the simple reason that the supply by far exceeds the demand. Look, as I have done, through all the great nurseries, and you will always find them full of clever men, waiting and waiting month after month, with bitter weariness, for the situation which, when it does come, is seldom equal to the man's deserts, and is often accepted out of desperation, and retained by the sacrifice of personal independence, by the suppression of natural inclinations, the swallowing of their real opinions, and the burden of daily injustice and contumely, which can only be remedied by their resigning the situation, and beginning again the weary waiting—for probably another similar place. I know that in a great number of places the gardener is treated as a man ought to be, setting aside the extra considerations of his ability, his intellectual capacity, and general excellence; but such places are few. I have been engaged in gardening all my life, and I know these things well, and I have serious thoughts of leaving it very shortly. I have tried it fairly, and borne quietly and uncomplainingly much injustice, and have seen much borne by my brethren around me. Nor did I lay these things so much to heart until my little ones began to cluster about me; and, while they brought with them much affection, they brought also increased responsibility and care, and have—as has been the case with many others—stood between me and a situation, while, if things were regarded in their proper and Christian light, they should have been the means to have induced those who had the power to have regarded me, and many others, with more consideration.

It is for these reasons, then, that I am so pleased by the contribution of "PENNSYLVANIA," and the promise of more, and I hope he will be as explicit as possible, and lay before your readers some useful knowledge on this subject. And I trust that many will see the necessity of turning their attention to this highly important topic, for I feel the conviction that there is in the West a substantial future for those who have the courage to venture to a land where they may, by a few years' toil, and perhaps some privation, lay up for themselves and children a secure and lasting home.—KALMIA.

NOTES AND GLEANINGS.

On the 10th inst. Mr. Stevens sold by auction the splendid varieties of *GOLDEN COLEUS* raised at the Royal Horticultural Society's garden at Chiswick. The following is a descriptive list, and the prices realised:—

Queen Victoria.—This is the brightest in colour of the whole series, having the centre of the leaves of a rich bronzy crimson, with a bright yellow edge, somewhat broken with crimson veinings, so as to appear as if the borders were formed of a double row of golden beads. 5 plants, £7 7s.

Princess Royal.—This is of nearly the same colour as the variety named *Queen Victoria*, but the edging is narrower, rather resembling a single than double row of beads. 5 plants, £15 15s.

Princess of Wales.—This has still less yellow than either *Queen Victoria* or *Princess Royal*, but has instead a much more decided and deeper glow of purple. 1 plant, £4 11s. 6d.

Her Majesty.—This variety is of very free habit, and the broad leaves are of a deep bronzy red, with the narrow beaded edging somewhat less golden-tinted than in the preceding. It is, however, very effective. £6 6s.

Albert Victor.—This, like *Her Majesty*, is of a very free habit of growth, having the centre of the leaves bronzy red, stained with large blotches of a deeper purplish red, while the golden margin is broader than in any of the other sorts, the marginal teeth being also marked out by red lines. It is a very attractive sort, and distinctly tricoloured. 7 plants, £15 15s.

Prince of Wales.—A free-growing variety, with leaves of a deep purplish red, marked with deeper-coloured blotches, and having scarcely any golden markings at the edge, so that it resembles *Albert Victor* minus the golden margin. 4 plants, £4 4s.

Duke of Edinburgh.—This is of a lighter shade of bronzy red than *Prince of Wales*, and almost whole-coloured, and is of a distinct contrasting hue. 6 plants, £5 5s.

Prince Arthur.—The leaves of this variety have a yellowish ground colour, while the base, the costa, and the principal veins are heavily marked with deep purplish red, the margin also being red. These markings give the plant rather a grotesque appearance. It has the close habit and general peculiarities of *Coleus Gibsoni*. 3 plants, £3 3s.

Princess Beatrice.—This is of a golden green hue, less heavily marked than *Prince Arthur*, the main veins being partially, and the margin entirely defined by crimson lines. This variety belongs to the *Gibsoni* type. 2 plants, £5 15s. 6d.

— We have been requested by the Trustees of the LINDLEY LIBRARY to make public the following list of books which have been ascertained, during the formation of the Catalogue by Mr. Bennett, to be incomplete, as it may enable those contemplating donations to the Library to make good the deficiencies:—

Agardh's Species Algarum. Vol. i., 1820. (Vol. ii., section prior 1828 wanting).

Agricultural Society's Journal. Vols. i.—xxii., 1840—1861 complete; also first part of Vol. xxv., and Vol. i., Part 1. New Series, 1865.

Annales des Sciences Naturelles. Complete to Vol. xvii. of Fourth Series, 1862.

Annals of Natural History. Complete to Vol. xii. of Third Series, 1863, and one Number of 1864.

Bentham and Hooker's Genera Plantarum. Vol. i., Part 1.

Blume's Museum Botanicum Lugduno-batavum. Vol. i., and 3 Parts, Vol. ii.

Blume's Collection des Orchidées de l'Archipel Indien. Vol. i.

Blume and Fisher's Flora Javae. Lorantheae wanting.

Bongniart's Botanique du Voyage autour du monde. 200 pp. instead of 232.

Cavanille's Monadelphica Classis Dissertationes. Vol. i. only.

Colla's Hortus Ripulensis. Appendix 1 only.

Curtis's Botanical Magazine. Complete from commencement of Second Series, 1827, to September, 1865 (except Third Series, Vol. iv., and Part for December, 1863); also Vols. iv. and vi. of First Series.

Décadence's Jardin Fruitier du Muséum. Vols. i.—vi., 1858—1864.

De Candolle's Prodrroma. Vols. i.—xvi. complete; also Vol. xv., sect. prior and sect. post, fasc. 1, and Vol. xvi., sect. post, fasc. 1.

De la March's Encyclopédie Méthodique. Vols. i.—viii. complete; Supplement, Vols. ix.—xiii. absent.

Endlicher's Genera Plantarum, and Mantissa. Mantissa altera wanting.

Fée's Conrs d'Histoire Naturelle Pharmaceutique. Vol. ii. only.

Fenille's Journal des Observations Physiques. Vols. i. and ii.; Vol. iii. absent.

Florist and Pomologist. Parts 1—9, 11—24, 26, 28.

Gardeners' Chronicle. 1841—1865 complete (except 1865 wants title and index).

Gray and Sprague's Genera of the Plants of the United States. Vols. i., ii.

Grisebach's Flora of the British West Indies. Section 1, and Parts, 5, 6.

Harvey's Thesaurus Capensis. Vol. i., and Nos. 1—3, Vol. ii.

Harvey and Sonder's Flora Capensis. Vols. i., ii.

Haworth's Supplementum Plantarum Succulentarum (but not the Synopsis Plant. Succ.)

Hogg's Supplement to Treatise on Florists' Flowers (not the Treatise).

Hooker's Species Filicum. Vols. i.—iii.; also Vol. iv., Part 2. Vol. v., Parts, 1, 2.

Hooker's British Ferns. Parts 1—3.

Hooker's Garden Ferns. Parts 1—3.

Horticultural Society's Journal. Vols. i.—ix., 1846—1855; also odd Nos. of Proceedings, 1863—1865.

Horticultural Society's Catalogue of Fruits. Second and Third Editions, 1831, 1842, and Supplement to Third Edition, 1853.

Horticultural Society's List of Fellows. 1862, and Supplement.

Humboldt's Aspects of Nature, translated by Mrs. Sabine. Vol. ii.

Kunth's Synopsis Plantarum. Vols. i., ii.

Lemaire and Van Houtte's Flore des Serres et Jardins de l'Europe.

Vols. iii.—ix., and 9 Parts, Vol. xv.

Lindley's Folia Orchidaceae. Vol. i.

Link's Anatomia Plantarum. 1st Heft.

Linnaea. Complete to Vol. xxxi., 1862; also four Parts, 1863.

Linnaean Society's Proceedings. Vols. i., ii., 1838—1855.

Linnaean Society's Journal. Vols. i.—vi., 1857—1862; also Nos. 25—35.

Linnaean Society's Transactions. Vol. xxiv., Part 3, Vol. xxv., Part 1, 1864—1865.

Loudon's Arborescentum et Fruticetum Britannicum. Vols. i.—iv., wants the Plates, Vols. v.—viii.

Lowe's Manual Flora of Madeira. Parts 1—3.

Martins's Flora Brasiliensis (8vo). Vol. i., Part 1. and Vol. ii., Part 1.

Meyer's Commentarium de Plantis Africae Australis. Vol. i. complete (wants title), and Vol. ii. to p. 400 (Lobeliaceae).

Miers's Contributions to Botany. Vol. i. only.

- Miquel's Flora van Nederlandsch Indië. Vol. i., Part 1, Vol. ii. and Supplement.
- Mohl and Schlechtendal's Botanische Zeitung. Complete to end of 1863, except Nos. 9 and 10 for 1863.
- Moore's Index Filicum. Parts 1—11, 14, 15, 17, 18.
- Muller's Plants Indigenous to the Colony of Victoria. Vol. i., and 1 vol. lithographs.
- Muller's Fragmenta Phytographia Australiæ. Vols. i.—iv.
- Noes von Esenbeck's Genera Plantarum Floræ Germanicæ. Seven Vols., as far as Chamærops.
- Parlatore's Flora Italiana. Vol. ii., Part 2, Vol. iii., Parts 1, 2.
- Paxton's Flower Garden, by Lindley and Paxton. Vol. i., 1850—1851, Vol. iii., 1852—1853, and No. 18.
- Payer's Elements de Botanique. 1re Partie, Organographie.
- Pearson's Synopsis Plantarum. Vol. ii. only.
- Pomological Magazine. Vols. i.—iii.
- Ramon de la Sagra's Histoire de l'Île de Cuba. Botanique, Vol. ii. only; Plantes vasculaires and Atlas.
- Reichenbach's Xenia Orchidacea. Vol. i., and three parts Vol. ii.

WORK FOR THE WEEK.

KITCHEN GARDEN.

At this season, with the constantly varying weather, little can be done in the kitchen garden. In light dry soils, however, a small sowing of the Early Frame *Pea* may be made. This will come in a little earlier than the crop sown in spring.

FRUIT GARDEN.

As there is comparatively not much of importance to attend to at this season, a good opportunity is afforded for renovating old borders, or forming new ones. The first work to be attended to, after removing unfavourable soil, is to render the border dry by forming a drain in front, the top of the drain being deeper than the bottom of the border, giving that border a good inclination from back to front, and then rendering it impervious to the roots of trees. Grouting with lime and gravel appears to be the best and cheapest means of effecting this object. A hard bottom may be dispensed with in favourable circumstances, particularly if there is no necessity for cropping the borders, as then by mulching the surface the roots would be encouraged to the top. From 1½ to 2 feet will be depth enough of good soil, where healthy fruit trees in opposition to mere luxuriance, are the object, giving the greater depth to Pear and Plum trees, Vines, &c., and the less depth to Peach and Nectarine trees. The next proceeding is to obtain a good supply of hazel-coloured loam, if it can be procured. This will answer admirably of itself for the Apple and Pear, for the Plum if kept somewhat adhesive, for the Cherry, if sand or road drift be added for the more tender sorts, for the Peach and Nectarine with the addition of about one-third of road drift or sandy matter, and a little leaf mould if the soil is naturally adhesive, and for Apricots, with less sand than for Peaches, a greater depth of soil being afforded. For Figs it will be better to restrain the extension of the roots, to keep the tree growing from one stem instead of forming suckers, and to supply necessary nourishment by mulching. For Vines the same soil will suit well, but it must be mixed with calcareous matter, such as lime rubbish, &c., and well manured with broken and bruised bones in preference to hotbed or other manure, as being more lasting

in their effects, and because the latter, when buried deeply, becomes useless, from being placed beyond the decomposing influence of the air. The addition of brickbats and large lumps of porous sandstone interspersed in the border, so as to keep it open, will be an advantage. Raspberries, and all kinds of fruit trees, may now be pruned. With regard to the former, which produce their fruit entirely on the previous year's wood, the old shoots should be removed, and four or five of the strongest of the young ones tied up in their places, cutting clean off to the root all the rest of the young shoots. After they are tied to the stakes shorten them to 4 feet in height. In exposed situations a good way of training Raspberries is to tie the points of one-half of the shoots on the stools to those of the next stool, thus forming arches, which have rather a neat appearance. This will also be found a favourable opportunity in case of very adhesive soil, for burning the most retentive part of it, using for this purpose the prunings of trees and any other rubbish. The scattering of the burned part will greatly ameliorate the working of the soil, or if it be deemed preferable, such prunings, along with Cabbage stumps, old tan, sawdust, &c., may be charred, and then the produce will be a useful top-dressing for Onions and other crops.

FLOWER GARDEN.

The tender varieties of Roses should be protected at once, otherwise it may be too late to save them. Also, obtain the stock of Briars for budding upon next year without delay, for unless these are planted before spring they seldom furnish strong shoots for early budding. Many persons object strongly to planting shrubs or trees in winter, believing that the roots, if injured at this season, are liable to rot, and certainly the early part of autumn is a preferable season; but in this favourable weather do not delay such work a single day, and if the soil is properly prepared by draining, &c., where necessary, as it should always be before planting, there will probably be fewer failures in planting now than if the work were delayed until March.

GREENHOUSE AND CONSERVATORY.

Although we have many beautiful plants which either bloom naturally at this season, or require but little artificial management to cause them to do so, a scarcity of flowers is, perhaps, more commonly experienced at this than at any other period of the year. Where the display is, to a large extent, dependant on what we term forced plants, considerable foresight and attention will be necessary for some time in order to maintain a regular supply, for plants are not so easily excited into bloom in the dead of winter as in spring; and in selecting plants for forcing, every possible care should be exercised to choose such as are not likely to prove failures, for of those which are suitable for forcing, many will bloom but poorly if they are subjected to a high temperature without being allowed a sufficient time to recruit their energies after making their growth. Next to Camellias, Indian Azaleas are the most showy plants that can be had in bloom at this season, and where there is a good stock of these to draw upon, some of the most forward varieties of the commoner sorts should be placed in heat at once, moistening them overhead two or three times a-day. Those Camellias which are now in bloom and opening their bloom buds should stand in the lightest, healthiest structure, and the house where they are should be kept free from cold evaporated moisture, as such, at this and the coming season for a time, is particularly injurious to the duration of the blooms, and the permanency of their colours, causing blotches and mildewed spots. Healthy strong plants which are loaded with a heavy crop of bloom buds, and are about commencing to bloom, may be greatly assisted by weak applications of clear tepid manure water. Dutch bulbs should be largely used for present forcing, and when hardy shrubs are forced for the decoration of this house they should be brought into flower as soon as circumstances admit, for although many of these are very showy when well bloomed, and acceptable enough when had in flower in winter, they hardly seem in place under glass in spring. Damp and insects at this season do irreparable damage to softwooded plants in the greenhouse, and these must be very carefully attended to if they are to be carried over the winter in first-rate condition. Pelargoniums should be kept rather cool and dry, giving whatever water may be necessary in the mornings of fine days, so that the superfluous moisture may be dispelled before evening, avoiding fire heat, except when necessary to prevent the temperature falling below 40°, or to dispel damp when this cannot safely be done by giving air. Keep the shoots thin, rubbing off such as can be spared, and if green fly is perceived on any of the plants, apply tobacco smoke at once. Cinerarias for late blooming must be kept cool

and airy, and should not be allowed to suffer from want of pot room; but these should not be trusted in cold pits after this period, for they are exceedingly impatient of frost. Forward plants of stock intended for flowering early should be encouraged with a gentle heat, keeping them near the glass, and admitting air at every favourable opportunity.

STOVE.

Although a kindly sweet atmospheric humidity is in this structure requisite to maintain vigorous health, the season is now arrived when it must be supplied very moderately, and so must heat. Clear days should be taken advantage of for any little extra application of either.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

LITTLE has been done here except slightly hoeing and forking among young crops to leave an open surface, and removing the withered leaves from old Cabbage stumps, Savoya, and Brussels Sprouts in bearing, as these, especially after frost, would be sure to emit anything but a pleasant odour.

FRUIT GARDEN.

Examined stores of Apples and Pears, and have found during the last month that many are likely to keep worse than usual. We were rather afraid of this, as after the dry summer they swelled so fast when the rains came, and then there seemed to be a deficiency of sunlight afterwards to dissipate the watery juices. Many of the Pears and Apples were more than usually well flavoured, but others were too juicy; and when they began to decay could scarcely be moved, turning to little else but juice. Some kinds of Apples, such as Margil and Cox's Orange Pippin, have kept extremely well, but they did not swell so much after the rains as many others. As a rule, most of the fruit that increased so rapidly after the rains have kept worse than usual, and even with the greatest care in looking over them some had to go to the rubbish heap.

The season has been so open, that planting, lifting, and root-pruning may still be proceeded with; but in the case of small bush or pyramidal trees but little of these processes will be needed when the tree arrives at a bearing state, if the roots are kept near the surface. One of the charms of a garden is, that chiefly by mere labour alone you can make an old garden look like a new one any day by changing and altering its prominent features. Even old proprietors are apt to weary at seeing things day after day and year after year in the same position; and old associations, however delightful at times, may become wearisome from their very monotony. A change may not always be an improvement, but nevertheless the change may be well worth making even for the sake of change, and to afford something fresh to engage the attention. In the little we have been able to notice of what is doing around us lately, we observe that there is a growing desire to do something in the way of opening up old places, by clearing away old trees, shrubs, &c., and throwing more into grass lawn—all very well if, in these days of economy, the future keeping of the lawn is taken into consideration. It would be well if proprietors and gardeners would bear in mind that a large lawn involves a large expense, for which there is little or no return except pleasing the eye. Other things may want attention now and then; but a lawn, to look well, will in general want weekly attention from April to November, and frequent rollings in winter. We know of some places where there is always a yearly attempt made to curtail the gardening expenses, and yet almost every year sees an addition made to the short grass, which, if it is to be kept ornamental, must involve the necessity of more labour. It is always well in such cases that a proper understanding should be come to between employer and employed, as in a case that a short time ago came under our cognisance. A gardener was very anxious to extend the dressed grounds in one direction. There could be little question as to its not merely being a change, but a great improvement. The gentleman saw it exactly in the same light, approved of the idea, which had often suggested itself to his own mind; but he added—"I can let you have extra help to make this change, but I cannot afford to give you more constant help to keep it up afterwards, and unless you can manage with the help you now have after the change has been made, we must let the matter alone." And it was let alone, though, no doubt, it will be done some day.

Years ago we attempted in a part of the enclosed grounds to combine the useful with the ornamental, and have a small

orchard in union with a bounding shrubbery, and a walk with the sides much diversified, and the ground chiefly appropriated to low flowering plants, Alpines, &c. This place, from the great variety at all seasons, and especially in the spring months, used to be a favourite resort, but as the orchard trees grew, it became less and less an object of interest so far as the useful was concerned. Unfortunately we had not taken into account the proximity of the farm buildings and the thatched roofs of the buildings most contiguous. This, and the feeding of game in the immediate neighbourhood, encouraged such crowds of birds, that every season we had the mortification to see each tree made a perfect skeleton, so far as the fruit buds were concerned, and even the prominent wood buds would be picked out; and the place was too small, and the number of trees too limited, to give occupation to a boy or a man to watch them, and even to do so the watcher must have got up before the sun. From this space, less than an acre of ground, we have frequently not gathered so much as from a bush tree in the kitchen garden, which would have been served in the same way but for dressing and the presence of workmen.

It has been resolved to change the whole aspect of the place by making it into a separate lawn, studded chiefly with specimens of Cypress, Pinus, and other trees, and as such it will, with its evergreen boundary, be a pleasing change at last. Lots of the largest trees were grubbed-up, but some of the best, with heads from 20 to 25 feet in height, were worth transplanting to some back settlements, where they would be more under the observation of passers-by and the workmen, as though the birds are impudent enough to go anywhere and everywhere, they are more shy in committing their depredations on the buds where their human enemy can be frequently seen, and the report of a gun at times be heard.

In ordinary circumstances we should have raised these trees with less or more of a ball, and used a small timber gig and its pole for bringing them down and carrying them, but as for several reasons this could not be well done, we dispensed with the ball, traced out the roots for about 4 feet from the bole, saved all the fibres possible, and carried the tree to its destination by men, with the assistance of levers.

Here several things may be worth noting for the sake of beginners. These trees, though so thoroughly picked every spring, generally made fresh buds every summer, so that if we could have found a suitable place we would have transplanted more of them. As the trees had little or no ball, the first thing to do on getting the tree down was to lessen the head a little, not so much by cutting it in as by thinning-out many of the smaller branches. This we consider much the better plan, as it leaves the points or axes of growth untouched, and there is then, we believe, a quicker reciprocal action between the roots and branches. The next thing was to set the tree in the hole prepared for it, so that it would stand perpendicularly, and no higher in the ground than it did before, in order that the collar of the plant might not be at all buried. To keep the tree perpendicular some packing under the roots as well as over the roots would be required, doing what was wanted under them chiefly at first. The firming of the tree in its position we generally like to do before packing the roots; the firming is not of much consequence for trees of that size when a good ball is taken, but of great importance when little or no ball accompanies the roots. The most simple support for trees such as these is a pole or stake, and we have seen infinite trouble taken in getting steps, &c., to mallet such stakes into the ground, and then proving, after all, a very poor security against high winds. We do this matter much more simply. Two stakes, or rather poles—such as the top of a Larch tree, &c.—from 10 to 12 or more feet in length, will support a tree larger than those referred to, and require no pointing or malleting. Before the tree is set in the hole make a small hole beyond in the firm ground, say a foot in depth; in this place the base of each pole, and bring the point of each to meet at the bole of the tree, fasten them firmly there with straw bands and rope yarn, mallet the soil round the base of the pole, and a hurricane will hardly move the stem of the tree. We planted some trees in a high wind, and they never flinched a bit, even before the roots were covered. When we thus use these poles, they are generally placed almost east and west. When secured, we can pack the roots better, using the best surface soil amongst them; and, when all packed, we give from four to half-a-dozen pails of water, and when that has sunk in, we put on, and beat pretty firmly the rest of the soil, leaving a basin to catch the rain, and to receive another watering in the end of March if the

weather is mild. Wherever such posts or poles would be unsightly, we have used chains fastened to a collar round the stem, and taken these to strong posts driven obliquely under the surface. For large trees three chains are necessary.

ORNAMENTAL DEPARTMENT.

Besides attending to the general routine, as alluded to in preceding weeks, we have been employed in making changes, moving shrubs with and without balls, and, in the latter case, on the same principle as has been alluded to in regard to the Apple trees. Here we might have something to say on the principle of making changes in gardens, such as turning turf into beds and beds into turf, so as to give fresh soil to plants with the greatest ease. We might also have something to say on pruning Laurels rather freely; and though we would prefer doing that in spring there is no danger in doing it now, unless we have a very severe winter, and spring brings so much to do with it; but we must leave these, and say a word respecting

Fresh-planted Young Trees.—We would direct prominent attention to the importance, in the case of forest trees, of well treading the soil about them afresh a few weeks after planting, and choosing a day when the soil is rather dry for performing such an operation. They will rarely want such treading afterwards, and gales will be unable to dislodge them, or bend them from the perpendicular. It is very difficult to get extensive planting done by men taken on at random. They will either put the plant too deep, or not deep enough, and of the two the first is the worse. In planting young Gorse by the dibber, not one in ten, though holding gardens, has any idea that the one oblique stroke, and then bringing the dibber with soil in the front of it right up perpendicularly to the plant, firms it better and more thoroughly than half a dozen puddling strokes. We have hardly ever known a better season for planting than this has been up to the present, as the ground as yet is far from cold.

Heating by Gas.—A number of small places have been heated by our recommendation and that of our condutors and the Conductors, but in all the cases with which we are acquainted the places were small, and the great convenience of the gas rendered the plan on the whole the most economical. Some small places have been heated by our recommendation, using merely a ring of burners in an iron stove, with a small pipe from the stove to take the products of combustion into the open air. We think this is the simplest mode in which gas can be used, merely making the gas take the place of a charcoal or coke fire in a stove. We noted carefully at the time, and circumstances have made us carefully consider just now, the various plans of heating by gas, reproduced in pages 278 and 279, in the number for October 10th, 1867. We know that all the plans there given can be made to answer, whether hot water is used or pipes are taken from the gas stove through the house; but all this hot water and taking pipes through the house are often inconvenient, and are all so far a departure from the simplicity of a common fire stove. Now, we have had little to do with gas stoves, in comparison with common fire stoves; but our idea is, provided you put enough of jets or of argand burners in a gas stove, that that should be sufficient to heat a small place without any other help whatever, unless a small pipe—say 1 inch or less in diameter, going directly out of the house, not from the top but the side of the stove, to take off the products of combustion, whilst air would be supplied from the bottom of the stove to keep the gas burning.

One, and a chief point, is wholly omitted in the number referred to—namely, the expense of the gas, a matter of no importance in a small place as set against the great convenience and saving of labour; but a matter of importance when a large place is desired to be thus heated, and where it would be very inconvenient to have any pipes from the stoves, except the discharge pipes into the open air. For the place we are thinking about, we should judge that six rings of gas would be needed, enclosed in six plate-iron stoves, resembling *fig. 7* or *fig. 1* at the pages indicated, each ring containing at least fifteen jets. Now these jets would on an average consume a cubic foot of gas per hour, and though in mild weather four or five hours' burning might be sufficient, in severe weather the gas would have to burn almost constantly, and in twenty-four hours, therefore, about 2000 feet of gas would be used. To know the value and the quantity of gas consumed in given circumstances would, therefore, be most important, and so would all facts bearing on heating a stove, such as plate iron or galvanised iron with gas, without any pipes, except a small waste pipe into the open air; and the smallest size of such pipe found effectual, as the smaller the pipe, if sufficient for the purpose, the more will the heat be concentrated in and given off by the stove. Our present

belief is that heating by gas will only be found economical when used for small houses, and then it is of all others the most convenient. For long most gentlemen's places will have their gasometer, and if, after paying everything, gas can be obtained for about 3s. 6d. per 1000 feet, it may be used for many purposes of heat as well as light.—R. F.

COVENT GARDEN MARKET.—DECEMBER 16.

VERY little business is being done, and prices are barely maintained at last week's quotations. Foreign produce presents no new features, the only thing worth notice is an importation of American Newtown Pippins of average quality. The Potato trade is very dull except in choice samples, which bring from 8ds. to 12ds. per ton.

FRUIT.

TRADE CATALOGUES RECEIVED.

Sutton & Sons, Reading.—*Suttons' Amateur's Guide and Spring Catalogue, 1868.*

R. Pennell & Son, Lincoln.—*Catalogue of Ornamental Trees and Shrubs, Forest Trees, Conifers, and Descriptive List of Fruits. Descriptive Catalogue of Roses.*

T. Cripps & Son, Tunbridge Wells, Kent.—*Wholesale Catalogue of Nursery Stock.*

W. Barron & Son, Elvaston Nurseries, Borrowash, near Derby.—*Catalogue of Ornamental Plants, Fruit Trees, &c.*

TO CORRESPONDENTS.

•• We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

BOOKS (W. H. B.).—Hefrey's "Rudiments of Botany," price 3s. 6d. You can obtain it through any bookseller (A. N. Parsons).—How to Farm Two Acres Profitably, would suit you probably. You can have it free by post from our office if you enclose fourteen postage stamps with your address. (W. Miller).—If you enclose twenty-seven postage stamps with your address, and order "Greenhouses" and "In-door Gardening," they will be sent post free from our office. They contain the directions you need.

NAME OF CORRESPONDENT (T. Williams).—We cannot state this, it causes far too much inconvenience. If any one offers in our columns to give away a few seeds he is deluged with applications.

BACK NUMBERS (E. S. F.).—You can have the back numbers if you specify them, and enclose their price in stamps with your direction. We cannot name plants from seeing their leaves.

ESPIRAN GRAPE (One Fond of Vine Culture).—The difference of opinion as to the merits of this variety probably arises from the Grapes being cultivated differently and in a different soil. We have eaten excellent Espiran Grapes grown under glass, and we have known that it ripens against a wall in the south of England, but we never tasted the produce. Do not remove your Vine until you have tried it, and we shall be obliged by your reporting to us the result.

GARDENERS' EXAMINATION (F. O.).—If you write to Mr. Richards, Assistant Secretary, Royal Horticultural Society's Offices, South Kensington, he will send you full printed particulars.

GROSS SHOOTS OF ROSES (C. W., Boston).—"It is difficult to say without seeing the trees what should be done with gross shoots as thick as a walking stick. If a tree were perfect in its wood without the gross shoot, I should cut it out altogether. If the form of the tree wanted perfecting where the gross shoot is, I should leave it in. If the wood of the tree is generally bad, I should either cut the whole of the old wood away, and cut the gross shoot to four or six eyes, so as to form a new head; or I would take a first series of flowers from the old wood, and then at once remove it. When I grew standards I practised both plans with success. It is a good plan where you have a gross shoot on a tree with inferior or decaying wood to cut the whole away in March, and form a new head from the gross shoot.—W. F. RADCLIFFE."

ROSE PRUNO AND GREENS—PROTECTING AND PRUNING (Q. Q.).—"I have never used Gishurst Compound. I cannot say whether it would prevent mildew; but, from what I have read, I think it would be useful in subduing insects. The best cure for Rose grubs in spring is to catch and kill them. My Manetti-stocked Roses bear such crops of buds that I never trouble myself about them. They save me the trouble of removing superfluous buds. If you were to dissolve aloes and wash the dormant buds, I think the Rose grub would not touch them. I have bought some as an experiment, and intend in February to syringe my Peach and Nectarine trees with it. I never knew any creature that was fond of aloes. A gentleman had a monkey that gnawed his own tail. In vain did he try to stop this bad failing, till at last he tried aloes with complete success. Pug never repeated his offence after the first taste of this nauseous drug. The winter buds that will not develop may be taken off, or left on till pruning time. The wood and bark of my Roses are so hard and well ripened that I see no need of defending them further than I have already stated. The Tea Roses and Tea-scented are defended additionally with fern and Asparagus balm, or straw. You have not, probably, 1853 Rose trees my present stock), to defend. If you have only a few trees and the materials, it would be safe to wrap loosely above the ground line, and tie with bast the whole of the Rose plants—protection. We get a killing winter about once in six or seven years; ordinarily Hybrid Perpetuals, if the wood and skin are ripe, do not need such protection. As a rule, whether a Rose on a Briar is for a pole, wall, or standard, it is best on removal to prune closely in the following spring. Gloire de Dijon, which is a Tea-scented Rose, need not be pruned so closely as a Hybrid Perpetual. Try 12 inches. Never prune Roses closely at the time of planting, nor till the buds swell.—W. F. RADCLIFFE."

APRICOT CASTING ITS FRUIT (Y. Z.).—We think the cause of the fruit dropping soon after setting is the boards not affording sufficient protection. You would probably succeed if you were to protect the tree at night with canvas or with woollen netting, until the tree is well furnished with leaves. In frosty nights and even frosty days the canvas may remain over the tree. Boards do not absorb and give out so much heat as a brick wall, and to that cause we attribute the falling of the fruit.

FILBERT CULTURE (An Old Subscriber).—The "Garden Manual" contains full particulars on Filbert culture. It may be had post free from our office if you send twenty postage stamps with your address.

COMPOSITION FOR WOUNDS ON TREES (Idem).—We find nothing better than white lead paint, adding a little lamp black to render it less conspicuous. The edges of the wound where the branch is sawn off should be pared smooth with a knife, and the wound well coated with the paint.

AMERICAN BLIGHT ON FRUIT TREES (Idem).—Nothing equals paraffin oil for the destruction of American blight. It should be applied with a brush, rubbing it well into the parts affected, and it may be applied to every part of the tree. It will free the trees of moss, but for destroying this we recommend dusting the stem and shoots whilst wet with fresh-slaked lime, making them quite white. Gishurst Compound will not destroy the buds of fruit trees unless used after they have begun to swell or are too strong.

GRASS VERGES (T. J.).—We think you will find that the grass verges will become firm and close if you keep them well rolled, and allow them to grow for a year or two without cutting with the edging-knife. Unless the situation is away from the shade of trees or buildings, it is badly adapted for the growth of grass. We would not put down edging tiles, as a live edging is always preferable. Have you tried Box edging?

IVY ON TREES (Quercus).—Ivy growing on trees is very injurious, and entirely prevents the production of fine timber. It may be desirable for clothing the trunks and branches of old trees; but for those of the size you name (10 inches in diameter), no time should be lost in removing it. It is no protection to the bark, and may be as safely removed now as in spring.

APHELANDRA LEOPOLDI LEOGY (Aphelandra).—Your plant may be cut down in February, and should be placed in a mild bottom heat and moist top heat, and when it has made shoots a few inches long, repot. You may cut every shoot back to within two eyes of the base, making cuttings of the tops of the shoots. These cuttings will strike freely in sandy peat, plunging the pots in a brisk bottom heat, and covering with a bell-glass.

FERN DISFIGURED (C. P.).—We cannot detect any insects or traces of their attacks on the fronds of the Ferns that you sent us. The "red rust" is neither more nor less than the spores of the Ferns, which at this season are shed, the spore-cases bursting, and the dust or spores being distributed over the fronds, giving them a brownish appearance, which, though a disfigurement, is natural, and shows health. Its being noticed last year on one plant only, and now on the whole, is a consequence of the increased age of the plants; all are probably this year fruiting. You may free them of the "red rust" by sponging the fronds with clean water, or gently syringing them, but we should prefer to leave them as they are, for we enjoy the harvest of Ferns quite as much as the spring.

CINERARIA LEAVES CURLING (A Constant Reader).—The leaves are, no doubt, curling from the attacks of green fly or other insects. Your only remedy will be to fumigate the plants with tobacco, shutting the frame up closely when the foliage of the plants is dry. Then fill the frame with smoke so that a plant cannot be seen from the outside. To keep in the smoke, the lights may be covered with mats. A calm night should be chosen.

SULPHURING HOT-WATER PIPES (Idem).—The hot-water pipes in a cucumber house may be coated with sulphur and it will do no harm; the fumes will act as a preventive of red spider. Sulphur may be placed in the evaporation troughs without injuriously affecting the plants.

PLANTING BORDERS (F.).—You do not state what you wish to plant—trees, shrubs, or what. If you state what you wish information about, we shall be glad to assist you.

CAMELLIA CULTURE (C. B.).—We think your young plants cast their buds from undue excitement. The buds, you say, were very small, and no doubt were not set until a late period. For flowering at Christmas the plants should be introduced into heat about the middle or end of March. Syringe them every evening and morning, and keep the atmosphere moist. Ainery at work is very suitable, as the temperature will be brisk, the atmosphere moist, and the shade of the Vines agreeable. If you have no vinery the temperature should be from 50° to 55° at night, and 65° by day, with a rise from sun heat. In this temperature the plants will push freely, and should have every encouragement by moisture, copious waterings, and slight shade from bright sun. Any pruning required should be performed before the plants are introduced into the house, the old plants being cut in rather closely, but the young plants should only have the straggling shoots shortened, so as to form plants of compact growth. If any potting be required it ought to be done, but the old plants, if cut back, ought not to be potted until they have broken, and made shoots a few inches long; then repot shading from sun for a time until the plants have recovered from the potting. They should be kept in heat until the growth is complete and the buds formed, then give more air and harden them off, and the buds will be well formed. The plants should be kept in a cool airy house after the buds are set, and if partially shaded from powerful sun all the better, but avoid too great shade, which is apt to make the foliage sickly-looking. You may shake the plants out of the peat and pot them in turfy sandy loam. To bring them into bloom at Christmas the house should have a temperature from fire heat of 45° or 50°. Azaleas in 4-inch pots should be shifted in spring, when they begin to grow, into pots 6 inches in diameter, giving them the same treatment as the Camellias, but peat soil.

POTATOES FOR EARLY AND SECOND CROPS (S. H. L. W.).—There is no better Potato for an early crop than Rivers's Royal Ashleaf, though the Ash-leaved Kidney is a few days earlier. Myatt's Prolific is a good early Potato, more prolific than the Ashleaf, but a few days later. Lapstone is the best second early Potato, but requires to be grown in light soil.

PEARS FOR PYRAMIDS (F. F. S.).—Citron des Carmes, 2; Fondante d'Automne, 2; Williams's Bon Christian, 2; Comte de Lamy, 4; Alexandre Lambré, 4; Beurre de Capiaumont, 2; Beurre Clairgeau, 2; Bergamotte Espereu, 3; and Louise Bonne of Jersey, 3.

FRUIT TREES FOR NORTH WALL (Idem).—The Morelle Cherry succeeds admirably on a north wall or aspect, and Red and White Currants and Gooseberries may be so grown, and desirably, for hanging late. The trees may be planted during mild weather until the end of February.

VINE BORDER (J. W. K.).—We have no doubt that the border will repay you for the labour. We would cover in the autumn when early forcing was resorted to. For years we have been anxious to make some fresh borders, and air-shafts with us have been a settled idea. The communicating with the inside of the house is good, but even much may be done by opening the air-shafts out of doors in warm days, and shutting them at night. Your plan will always insure plenty of sweet, moist, fresh air in the house.

FLUE ARRANGEMENTS (C. B., a Young Gardener).—Your plan of obtaining bottom heat and top heat from a flue is very good, and so is the contrivance by means of a plate and damper, for securing instant draught by sending the smoke and flame up the chimney at once on lighting the fire, and then sending the heated air round the flue, when the air in the chimney is rarefied. Your plan, however, could only be put in operation when the chimney stands over the fireplace, and, therefore, in other cases where the chimney may be at the further end from the fireplace, the plans adopted by an engineer and "K. F." will be applicable. We agree with you that much may be done by small flues. We have one, the top of which forms part of the flooring, that answers admirably.

TREATMENT OF POTTED PLANTS (T. J.).—The plants will thrive all the better of having the surface soil stirred as you propose for three-quarters of an inch in depth. This stirring will keep out frost better than if the surface were hard and smooth; but plants in pots in general should be protected from frost by other means as well. When leaves begin to fade they may be cut off as a general rule, as, after fading begins, they take more from the plant than they return to it. In some exceptional cases even half of a sound leaf, however, is better than none. For your wall overshadowed by trees, we could advise nothing better than the different variegated Ivies, which will always look well. We have seen Cotoneaster microphylla do well in a shady place, but it will not cover the wall so soon as the Ivy.

PLANTING OUT VINES FROM POTS (T.).—If you had taken a heavy crop from the Vines we would have said throw them away; but as you have been moderate we would plant them out, reducing the head one-third or half, and spreading out the roots, instead of having them coiled round as in a pot.

PYRAMIDAL PEAR TREES PARTLY DEAD (C. A.).—We cannot tell without more particulars what is the matter with your pyramidal Pear trees, but should judge they are suffering from one of two causes—excess of moisture or starvation. If the first is the cause try what draining or raising the roots will do. If the second suggestion is the cause, as we suspect, fork the surface soil, and cover with two or three inches of rotten dung, and repeat the application in the summer.

FIRS ATTACKED BY RABBITS (P. I. N.).—If your trees are not numerous tie a small handful of straw round each. It will keep all depredators of that kind away. Dabbling the stems with dung, lime, and brine will keep the marauders off for a time. The most effectual safeguard is wire netting, 3 feet in height.

MUSHROOM CULTURE.—A correspondent, "FAILURE," wishes "AGRICULTURE" to state the kind of structure his beds were made in. We can see nothing wrong unless "FAILURE" had had spawn, and used too little of it. We do not know the size of his bricks, but eight of them do not seem much for four large beds. He ought to have succeeded with beds spawned in April; but, unless coolness could be ensured, we should be less surprised at the not succeeding when spawning in June.

WINTERING COLEUSES (R. J. S.).—They will be best wintered in the conservatory, assigning them the warmest situation. Only a little water should be given occasionally to keep the foliage from flagging. The situation should be light and airy, and free from damp or drip. In a

dwelling-house Colenses do not winter; indeed, to winter them safely a house with a temperature of 45° or 50° is necessary.

GRAFTING RHODODENDRONS (*A Constant Reader*).—The best time for grafting Rhododendrons is at the end of August or beginning of September, after growth is complete. Whip or side grafting is the mode employed. The stocks should be placed in a cold frame as worked, and kept close, moist, and shaded from powerful sun until the grafts have taken. Grafting may also be very successfully performed in April, just before the plants begin to grow, the stocks being placed in a frame over a mild bottom heat of about 70°. Keep close and shaded until the grafts begin to grow, then gradually harden off.

PRUNING IRISH YEW (*A. P.*).—We do not advise cutting Irish Yews for they are so slow-growing that a very long time must elapse before the gaps are filled up, and until then the trees will be very unsightly. If you can, by shortening the long shoots and other pruning, preserve the symmetry of the trees, by all means prune, for they will bear any amount of pruning. Could not the branches be tied with tarred rope not very closely together, so as to improve their appearance? They will then become more compact, but do not crowd the branches very closely, but leave room between for the young shoots.

SOWING WALLFLOWERS FOR SPRING FLOWERING (*North Yorkshireman*).—The best time to sow Wallflowers for planting in flower beds for winter and spring flowering is from April to June. Sow in light rich sandy soil, and in an open situation. When the seedlings are large enough to handle they should be pricked off in beds, allowing each plant a space of about 3 inches. In October take up with good balls, and plant in the flower beds, or planting may be deferred until the beds are cleared of the summer-flowering plants. There are several colours; the best are the blood red, brown, purple, and yellow. We prefer and employ *Cheiranthus Marshalli* (yellow), which is propagated by cuttings or slips. We also use the common garden Wallflower seedlings for borders; but they vary so much in colour that for beds they cannot be depended on, otherwise they are of the sweetest and most useful of winter and spring-flowering plants. The flowering will be over by the time the beds are required for bedding plants.

CUCUMBER FORCING (*Idem*).—Your proposed plan of a tan bed enclosed by a sort of wicker-like frame to keep it up will answer very well; but the frame must not rest on the stakes, but be set on the tan, placing a brick under each corner. If you set the frame on the stakes the tan will sink, leaving the frame too high, and the soil and plants settling with the tan will be at too great a distance from the glass; the soil, too, will most likely crack, and there will be a space between the soil and frame through which air will pass; and though that might be prevented by the dung lining, yet steam from the latter cannot be kept from entering, and in a single night a part, or the whole, of the plants may be destroyed. The dung lining will be excellent for keeping up the heat. We should not begin until February, and we think a better result will follow than by commencing in January.

POTTING HEATHS (*Idem*).—The best time to pot Heaths is early in March, and, if the plants are young, again in June, but the shifts should be small.

CLARKE'S COMPOUND (*W. H. H.*).—The places where it can be purchased are stated in his advertisement in our Journal of December 6th.

STOCKS FOR EPIPHYLLUMS (*H. D.*).—*Pereskia aculeata* is the stock most commonly employed, and it answers very well. *P. portulacaefolia* is sometimes used, and is good for the purpose. We do not know where you can obtain the stocks, but if you were to write to the principal nurserymen they would probably be able to serve you. The stocks are usually raised from cuttings, which strike freely in sandy soil, and in one or two years make plants fit for grafting. They should be trained with one shoot until of the height required; then cut off the head of the stock

and put upon it a scion or graft of the *Epiphyllum* in the manner of tongue or whip-grafting, securing with matting, and placing a little moss over the junction.

SOIL FOR SANCHEZIA NOLII VARIEGATA (*Idem*).—It succeeds in a compost of equal parts of turfy loam, sandy fibrous peat, with one-sixth of old dry cow dung and silver sand.

ELIPHIANT'S FOOT (*TESTUDINARIA ELIPHANTICES*) CULTURE (*W.*).—The preceding is the proper name of the plant called Elephant's Paw or Foot. It does not require any peculiar treatment beyond that of a greenhouse climber. It dies down in winter, and should then be kept dry. A compost of two-thirds sandy turfy loam, and one-third sandy peat, with good drainage, will grow it well. The shoots should be trained near the glass, and the plants well supplied with water when growing.

WINTERING PELARGONIUMS IN SPARE ROOM (*S. E. C.*).—Your mode of treatment is right. The plants will winter safely without water, though you may give a little to prevent the wood shrivelling. Those in the frame should not be watered, but must have all the air possible. Pick off all dead yellow leaves, and cut away any stems that are damping off. The *Fuchsias* will do well if kept from frost. The soil should be kept dry. *Camellias* and *Azaleas* should have the soil moist in winter, but they will not then require water so often as in summer, the soil, however, ought to be moistened through. You should have the stove made to draw so as to prevent the smoke coming into the house, and dust may be avoided by sprinkling water over the ashes or fire before raking it out. The stoves in pots should be removed to the greenhouse before severe frost, and placed in the coolest and most airy situation that is well exposed to the light.

GROUND VINERY (*St. Denis*).—If it is span-roofed and its ends placed north and south, and two Vines planted at each end, it would be possible, as it is 34 feet wide, to ripen Grapes in it on the four Vines for one year. The Early Black Bordeaux, Chasselas Virent, and Black Hamburgh are suitable. Of the other we know nothing.

COCKSCOMB STRAWBERRY (*W. B.*).—The Rev. Mr. Radclyffe's testimony to the large size of the Cockscomb Strawberry was published in our Journal on August 27th. Of the statement's truth there is not a shadow of doubt. We cannot republish it, and any one wishing to see the account can have the number by enclosing four postage stamps with his address.

HEATING APPARATUS (*A Constant Subscriber*).—We have not tried the apparatus you mention. The Index will not be ready until the second week in January.

NAMES OF FRUITS (*A Lover of Fruit*).—The Cockscomb Strawberry was described in our last number. *Semper fidelis* Raspberry is not known to us by that name. There being hundreds of named Gooseberries no one can identify any by mere description. We do not think that Walnuts could be bush-grown.

NAMES OF PLANTS (*D. H.*).—*Atriplex portulacaoides*. (*G. P.*).—1, *Selaginella Martensii*; 2, *Aspidium coriaceum*; 3, *Adiantum affine*. (*J. Blackburn*).—*Maxillaria crocea*. (*A Constant Reader*).—1, *Euphorbia splendens*; 2, *Lavandula santolimaefolia*; 3, *Aloe spinulosa*; 4, *Opuntia microdasys*; 5, *Gasteria angulata*. (*Greenhouse*).—*Abelia floribunda*. May probably stand a mild winter in Devonshire, but is rather tender. (*Amateur*).—1, 2, and 4, Not recognised; 3, *Asplenium trichomanes*; 5, *Asplenium filaceum*; 6, *Pteris serrulata*; 7, *Asplenium adiantum-nigrum*; 8, *Nephrolepis* sp.; 9, *Polypodium vulgare* (a crested variety); 10, *Davallia pulchella*; 11, *Cystopteris alpina*?; 12, *Selaginella Martensii*; 13, *Pteris cretica*; 14, *Doodia caudata*; 15, *Polypodium dryopteris*. (*R. H.*).—1, *Selaginella Braunii*; 2, *Gymnogramma tartarea*; 3, *Asplenium ruta-muraria*. (*W. T.*).—1, *Echites melaleuca*; 2, *Asplenium esculentum*; 3, *Platylema cordata*; 4, *Cheilanthes odora*; 5, *Adiantum concinnum*.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending December 15th.

POULTRY, BEE, AND HOUSEHOLD CHRONICLE.

GAME FOWL CHARACTERISTICS.

HAVING just returned from the Poultry Show at Birmingham, I am impelled, as a fervent admirer and tolerably experienced breeder of the noblest of domestic fowl, the English Game cock, to offer some remarks on the general character of the birds exhibited in the Game classes at Bingley Hall. It may be necessary for me to premise that I had no interest whatever in the Judges' decisions—that I was not an exhibitor, nor concerned in any of the exhibits. This is the first great show I ever saw in England, and probably for that very reason some of your readers may be interested in this record of my impressions.

In the first place, I am bound to bear witness that the show

of Game fowls was in one respect far beyond my expectation. A finer collection of high-bred and well-conditioned fowls had, probably, never been brought together. There could not be a more striking evidence of the favour in which these beautiful birds are held, than the appearance of the Game department as compared with any other in the Show. To pass from the graceful, sprightly, and intelligent occupants of the Game pens to the uncouth Cochin and the hideous Houdan, was indeed to exchange good company for bad—to descend from civilisation to savagery. It was Hyperion to a satyr—Blair Athol to a jackass—the last beauty at Almack's to the Hottentot Venus. However, *chacun a son goût*. I do not quarrel with those whose tastes are for the fluffy-sterned Cochin-China, the ghost-like *Cécile Cœur*, or the squat Dorking. I have only to say, on behalf of my own favourites, that never was so grand a display of perfect form, breeding, and

condition, as was exhibited by the Game classes in the Birmingham Poultry Show. I can but admire, not envy, the Judges who had to decide among individual specimens so nearly equal in beauty and in goodness. To one or two of their judgments I might be disposed to demur, but on the whole, having regard to the difficulties of their task, and also to the fact that they are necessarily in a better position to judge of the merits of the birds than any of the spectators—from having the privilege of handling the specimens, without which handling no Game fowl can be truly judged—I am forced to admit that the awards were very fairly made.

While, however, almost all the birds that were exhibited were good of their kind, I could not help observing that some kinds seemed to be better developed and of higher excellence than others. The Brown Reds, especially the cocks, were a wonderfully good class, and perhaps the best in the Show. The Black Reds were scarcely at all inferior, and the Duckwings were almost perfect. I was struck, however, by the fact that these three kinds seemed to have monopolised all the attention of the breeders and the favour of the Judges. Not only this, I could not help remarking on the general sameness of all the specimens in each class, in every point. Every Black Red was like his neighbour almost in every feature and in every shade of colour. Now, this may be the perfection of breeding, but does it not become a little monotonous? Is it even true that the type of Game cock preferred by the Judges is the highest in each kind? What have the old cockers to say on this point, who, after all, have some claim to be heard on the subject?

Is it admitted, for instance, that Black Red cocks should have legs of no colour but willow green? Willow green may be a very pretty colour, but I refer to all the authorities, and I find that a Black Red cock may have legs of any colour but black. Yellow, white, blue, and slate, used to be once, at least, as common a hue for a Game cock's leg as willow. Why are these colours shut out altogether as though they were disqualifications? Anybody looking over the Black Red classes at Birmingham, who was not previously acquainted with the subject, would naturally come to the conclusion that the one correct colour for a Black Red fowl's legs is willow. But is it true that willow is even the best colour? and if not true, is it wise to encourage none but willow legs? All the old-fashioned professional cockers will tell you that willow-legged cocks are by no means the best in the pit—that they have not, in fact, the highest qualities required in a Game cock, which are, courage and endurance.

The object of a show is surely to develop the highest type in its kind of the bird exhibited, to encourage the growth of the best, and not only the most beautiful animals. A Game cock not pre-eminent in courage is worthless. I will not venture, in this place, to offer a word in favour of cock-fighting, although I have much to say on that subject; yet it will be universally admitted that a Game cock that cannot fight is untrue to his nature. He has no *raison d'être*. He is worse than an orator without speech, a horse that cannot run, or a pig that cannot yield bacon.

It may be difficult, I admit, for the judges at a show to determine what are the moral qualities of the animals submitted to their judgment; yet it is only fair to ask that they should concede something to the opinion of those practically acquainted with the subject. That opinion is founded on many years' experience, and the tradition that a Game cock with willow legs is not to be relied upon for his conduct in war is worthy of some respect. There must have been some foundation in the general theory which held that the highest courage in a Game cock was always found associated with legs of a certain colour. At least, there is no reason why any special favour should be shown to willow legs. In my opinion a bright yellow leg is more in harmony with the general colour of a Black Red cock than a green leg. Black Red cocks with white legs, it is well known, are among the highest-bred of their kind, and certainly the best bird I ever knew in my life, for all practical purposes, was one of this breed, descended from the famous Derby strain. I do not desire that any pre-eminence should be given to one colour over another. All I contend for is, that all colours should be equally judged; that, other things being equal, no preference should be given to the willow leg over the yellow, the white, or the blue.

In the case of the Duckwings, I observed at Birmingham the same disposition to narrow the varieties of colour. Most of the birds shown were, in the first place, clearly not pure Duckwings—that is to say, they had not been bred by Duck-

wing cocks out of Duckwing hens. I missed the beautiful old-fashioned Silver Duckwings. The modern style of Duckwing, though unquestionably handsome in appearance, shows in its predominance of red, yellow, and chestnut, that he has been crossed with the Black Red. In this class, again, it seems that the Judges will allow only one colour of leg, although Duckwings have naturally as many varieties of colour in the leg as any other breed. In my opinion, a bronze or yellow-green leg looks best under a Duckwing cock.

Of the Brown Reds I have nothing to say, except that they seemed to me to be as near perfection as possible. I can remember, however, when the Brown Red cock was lighter on the breast, without derogation from his beauty, than he is now. The Piles were but an indifferent class, and seem to suffer from the discouragement of the Judges. Here, again, the willow leg appears, although singularly out of harmony with the red and white feathers. Surely it is manifest to every properly educated eye, that no colour in the leg can match the body of a Pile cock so well as either yellow or white.

And now I come to my principal complaint of this Birmingham Show, which is, not only that the birds in each class are bred too narrowly after one type and one colour, but that the classes themselves do not fairly represent the breed of English Game fowls. Considering how the present breed of Game fowl has been obtained—by a process of artificial selection through many centuries, the object throughout which was to rear only the best, that is, the most courageous and the most warlike in their kind—there is, I fear, too much danger that the breed will degenerate under the new influences which are brought to bear upon its perpetuation. If we breed only for beauty and for colour, we shall obtain beauty and colour, but at the certain sacrifice of all those other qualities for which the English Game cock has hitherto been famous. There is no reason, of course, why we should not have both the highest moral and the highest physical qualities combined; but that can only be by our attending equally to the signs of courage and endurance in the Game cock as to his appearance and condition at a show. I do not mean to say, of course, that there should be a series of mains fought on the floor of Bingley Hall to determine which are the best birds. I simply contend that the Judges should pay a little more respect than they appear to do to the opinions and the traditions of the "pit," and that they should not be influenced by any arbitrary views of their own as to what should be the right colour of a cock's leg, the correct hue of his hackle, or the proper carriage of his tail. If the Judges have no right to make new laws of their own upon the chief points requisite in each breed, still less are they justified in restricting the number of breeds, and in favouring one or two fashionable varieties at the expense of others. The use and value of such shows are, or ought to be, not to diminish but to increase the number of all distinct and true varieties—even to encourage the production of new varieties. One would imagine from a glance at the pens in Bingley Hall, that the only pure Game fowls in the world are the Black Reds, the Brown Reds, the Duckwings, the Piles, and the Black. But is there no other variety deserving encouragement? What have become of the Duns? Is the ancient race of Smocks extinct? Are there no Birchen Yellows surviving? Is the henny cock a fossil like the Dodo, of which the memory is borne only in the apocryphal chronicle of Tegetmeier? Surely all these are distinct and interesting varieties, which deserve the attention of the managers of the Birmingham Show. I only saw one Dun cock at Bingley Hall, and he, with his undoubted crest, seemed to be ashamed of being in that proud company. Yet the Duns, in all their sub-varieties, are beautiful and interesting birds, as true Game as any other.

The Birchen Yellows, again, were famous in the olden time, and ought to have their representatives in any collection of Game fowl. They are at least as distinct a variety as the Piles, and certainly not less beautiful. The henny cocks, of which some ignorant writers speak as though they were abortions or *lusus nature*, are a true variety, as I can testify of my own experience. They can reproduce their kind with perfect certainty, if matched with hens of their own breed, and I have no doubt they are still to be found in Cornwall and the western counties, where they were once celebrated for their prowess on the battle field. Considering the magnitude to which this Birmingham Show has reached, the extent of its resources and its popularity, and the influence it exercises on the breeders, I do not think that it is too much to ask that the managers should give encouragement to every known variety of Game fowl, by establishing distinct classes for each kind. I do not know why even the Tassels and the crested varieties should no

be revived, although the "Muffs," as perpetuating an offence to symmetry of form, and the "Cuckoos," as being a violence to harmony of colour, may be suffered to die away.

To sum up, my principal objection to these large shows is, that they tend to narrow instead of to enlarge the field of fowl culture. They are too exclusive in their preference of certain few varieties. They make all the breeders run in the same groove. In the special case of the Game fowls, they favour certain arbitrary ideals of form and colour, without sufficient regard to the true character and normal type of the breed.—H. E. W.

FRAUDULENT ARTIFICES IN PREPARING BIRDS FOR EXHIBITING.

MANY thanks are due to "NEMO" for the active measures he is taking to suppress the disreputable practices of trimming and plucking poultry for exhibition; may he never grow weary until a trimmed fowl at any show shall indeed be a *rara avis*. To accomplish such a desirable condition in all classes is no mean task, and may require the countenance and support of all right-minded exhibitors, which we may hope will be readily and continuously granted.

When looking at poultry exhibited I have often wondered at the supineness of judges on the matter, and the favouritism shown to birds evidently tampered with. Last spring I purchased (without seeing her), a Brahma hen, upon the recommendation that she was believed by the vendor to have won more prizes than any hen ever bred; she is now nearly through her moult, and, as may be expected from so successful a winner, has thrown out an ornamental pair of vulture hocks, too profuse for further exhibition, which I shall be happy to show to "NEMO," or any of the judges who may like to see their pet hen in her natural condition.—J. H. CUFF, *Metropolitan Cattle Market*.

MUCH pleased ought all honest exhibitors to be with the action taken by "NEMO" at the Birmingham Show, towards putting a stop to the most unfair practice of trimming Brahma Pootras—a practice that, if not checked, would bring poultry exhibitors to the level of turf-sharpeners, and drive respectable people with disgust from a fancy where success could only be obtained by cheating.

Let exhibitors now vigorously follow up the step that has been taken, and we shall quickly have the satisfaction of observing the discontinuance of these frauds.—BRISTOL.

LONGTOWN POULTRY SHOW.

THE Show held at Longtown, near Carlisle, on the 9th and 10th inst., proved a decided success, there being upwards of two hundred entries of Poultry, Pigeons, and Canaries. For the latter two, however, there being only one class for each, the competitors were not numerous. Game fowls and Golden-pencilled Hamburgs were well represented. The following is a list of the awards:—

GAME COCK.—First, Joseph Brough, Carlisle. Second, R. Little, Dickla tree. Third, J. H. Wilson, St. Bees. Highly Commended, G. Hall, Kendal. John Brough.

GAME.—First, John Brough. Second, Joseph Brough, Carlisle. Highly Commended, J. H. Wilson. Commended, R. Fawkes, Bush Crossings. *Chickens*.—First and Second, Joseph Brough. Highly Commended, T. Maxwell. Commended, John Brough.

GAME (Duckwings).—First, Joseph Brough. Second, T. Maxwell. Highly Commended, J. Barrow, jun., Kendal. Commended, T. Davidson, Longtown.

HAMBURGERS (Golden-spangled).—First, G. Holmes, Bedlington Station. Second, J. Walker, Knaresborough. Highly Commended, A. Hattlie, Selkirk; R. Dickson, Selkirk. *Chickens*.—First, R. Tyson, Longtown. Second, W. Smith, Ainderby Steeple, York. Highly Commended, A. Hattlie, R. Dickson.

HAMBURGERS (Golden-pencilled).—First, T. Musgrave, Longtown. Second, R. Barrow, Longtown. Highly Commended, J. Walker; W. Bowe, Carlisle. *Chickens*.—First, F. Johnson, Walton House. Second, J. Armstrong, Longtown. Highly Commended, R. Little; R. Irving, Dickla tree; J. Armstrong. Commended, B. Bee, Goornough, Preston.

HAMBURGERS (Silver-spangled).—First, G. Holmes. Second, W. Bowe. *Chickens*.—First, W. Bowe. Second, G. Dobson, Longtown.

HAMBURGERS (Silver-pencilled).—First, J. Walker. Second, J. Musgrave. *Chickens*.—First and Commended, J. Musgrave. Second, J. Walker.

DORKINGS.—First and Second, G. F. Lyon, Kirkcubrecht, Dumfries. *Chickens*.—First, J. H. Wilson. Second and Highly Commended, G. F. Lyon. Commended, R. Reid, Moat.

SPANISH (Black).—First, H. Wilkinson, Earby, Skipton. Second, Miss J. A. Musgrave, Longtown. Highly Commended, Miss J. Nelson, Eaglesfield; Bowman & Fearon, Whitehaven.

ANY OTHER VARIETY.—First, Miss J. Nelson (White Cochins). Second, Bowman & Fearon. Highly Commended, Mrs. Thomson (Buff Cochins); F. Johnson (Houdans); J. J. Walker, Kendal (Houdans).

GAME BANTAMS (Any colour).—First, Dalzell & Armstrong, White-

haven. Second, Bowman & Fearon. Highly Commended, J. Wallace, Ravenwood; B. Bee. Commended, R. A. Allison, Scaleby Hall.

GEER.—First, Mrs. Birkett, Broom Rigg, Ainstable. Second, Mrs. McBurnie, Pauld Mill. Highly Commended, R. Reid. Commended, T. Boyd, Glinger Burn; Miss M. Morton.

DUCKS (Aylesbury).—First, G. F. Lyon. Second, R. Lattimer, Cannobie. Highly Commended, J. Little, Woodhouselee; Mrs. Thompson.

DUCKS (Rouen).—First and Second, G. F. Lyon.

DUCKS (Any other variety).—First, Mrs. Thompson (American). Second, I. Fawkes, jun.

SELLING CLASS.—First, H. Wilkinson (Spanish). Second, J. H. Wilson. Highly Commended, R. Lattimer (Aylesbury); Bowman & Fearon; R. Reid, Moat; F. Johnson (Silver-spangled Hamburgs); T. Davidson. Commended, R. Reid; J. Armstrong, Longtown (Golden-pencilled Hamburgs).

ANY VARIETY (Confined to Arthuret and Kirkcubrecht).—First, Miss J. A. Musgrave. Second, R. Reid. Highly Commended, F. H. Musgrave, Longtown; F. Hayton; R. Reid.

PIGEONS.—Any variety.—First and Second, F. Graham, Birkenhead. Highly Commended, G. R. Sibson, Carlisle (Red and Blue Croppers); F. Graham, Birkenhead; J. Chambers, Longtown; J. N. Harrison (Owls); R. Whittaker, Bolton; J. & W. Towerson, Egremont. Commended, R. Pickering, Brampton; W. Cullen, Longtown (Owls).

CANARIES.—First, W. Hutton, Purdum's Crook. Second, J. N. Harrison (Norwich). Highly Commended, R. Irving, Dickla tree; J. Chambers, Longtown; Miss E. Jackson, Longtown.

SWEETSTAKES FOR TWO HENS.—*Dorkings*.—Prize, W. Bearpark, Ainderby Steeple. Highly Commended, Mrs. Thompson. *Hamburgs*.—Prize, T. Musgrave, Longtown. Highly Commended, Miss M. Jackson. *Game*.—Prize, J. Armstrong, Cannobie. Highly Commended, Mrs. Thompson.

The Judge was R. Teehay, Esq., of Fulwood, Preston.

LEIGHTON BUZZARD POULTRY SHOW.

THIS year's meeting very far surpassed its predecessors both as to the number of entries and the excellence of the generality of the specimens exhibited. There was a near approach to three hundred entries; but unfortunately, from that well-known error so much indulged in by owners, and which we have so frequently exposed, of leaving the dispatch of birds to the last possible train, more than forty pens proved empty at the time of judging, though almost all of them, it appears, arrived some time the same evening.

Of *Bantams* alone there were upwards of fifty entries, and the specimens were of excellent quality. Eight pens of Golden and Silver *Pheasants* added much to the beauty of the Show, and their plumage was excellent. About fifty pens of first-rate *Pigeons* were exhibited, and the arrangements of the Show generally were excellent. As the weather was fortunately most favourable the number of visitors was very satisfactory, and no doubt the support of numerous new subscribers to this Show would be secured.

GAME (Black-breasted and other Reds).—First, S. Matthew, Stowmarket (Brown Reds). Second, J. Laming, Cowbarn, Spalding (Black Reds) Third, R. Hall, Cambridge. Highly Commended, Capt. Wetherall, Loddington; Rev. C. Mayor, Wavendon.

GAME (Any other variety).—First and Cup, S. Matthew, Stowmarket (Duckwing). Second, Withheld. Third, B. S. Lowndes, Stony Stratford (Duckwings).

GAME (Any variety).—*Hen or Pullet*.—First, S. Matthew (Brown Reds). Second, R. B. Stafford, Fenlake, near Bedford.

DORKINGS (Any variety).—First, Mrs. Seamons, Hartwell, Aylesbury. Second, Rev. J. S. Lowndes, Hartwell, Aylesbury. Third, J. Longland, Grendon, Northampton. Commended, W. H. Denison, Woburn Sands; Mrs. Seamons; J. H. Roper, Barham, Ipswich.

COCHIN-CHINA (Cinnamon or Buff).—First and Cup, J. Cattell, Birmingham. Second, F. W. Rust, Hastings. Third, J. N. Easley, Brampton.

COCHIN-CHINA (Any other colour).—First and Second, G. Shrimpton, Leighton Buzzard (White). Third, B. S. Lowndes (Partridge). Commended, B. S. Lowndes (Partridge); E. Shaw, Plaas Wilmot, Oswestry (Partridge).

BRAHMA POOTRA (Any variety).—First, Hon. Miss E. Douglas Pennant, Penrhyn Castle, Bangor. Second, Mrs. Farquharson, Towcester (Pencilled). Third, Mrs. Burrell, Stoke Park, Ipswich. Highly Commended, P. H. Jones, Fulham. Commended, Hon. Mrs. A. Raillie, Hamilton-Ridgmont, Woburn. *Pullets*.—First, Hon. Miss E. Douglas Pennant, Second, J. K. Fowler, Aylesbury. Third, U. Spary, Dunstable.

CRÈVE-CŒURS, HOUDANS, and LA FLÈCHE.—First and Cup, R. Hurman, Cowley, near Oxford (Crève-Cœurs). Second, Lady L. Charteris, Eccles Hall, Attleborough (Houdans). Third, J. K. Fowler (La Flèche). Highly Commended, Capt. Wetherall (Crève-Cœurs); D. T. Willis, Leighton Buzzard (Crève-Cœurs);—Barford, Aylesbury, Bucks (Houdans). Commended, Col. Stuart Wortley; J. K. Fowler (Crève-Cœurs).

SPANISH.—First and Second, W. R. Bull, Newport Pagnell. Third, E. Brown, Sheffield. Highly Commended, W. B. Jeffries, Ipswich. Commended, J. R. Rodbard, Wington, Bristol; P. H. Jones. *Hens or Pullets*.—First and Cup, F. James, Peckham Rye. Second, P. H. Jones. Highly Commended, Hon. Miss E. Douglas Pennant.

HAMBURGERS (Golden or Silver-pencilled).—First, W. K. Tickner, Ipswich (Golden-pencilled). Second and Third, U. Spary, Dunstable (Golden-pencilled).

HAMBURGERS (Golden or Silver-spangled).—First, S. & R. Ashton, Roe Cross, Mottram, Cheshire (Golden-spangled). Second and Third, Rev. F. Tearle, Gazeley Vicarage, Newmarket (Silver-spangled).

POLISH (Any variety).—First, Second, and Third, G. W. Boothby, Louth (Golden). Highly Commended, Lady L. Charteris (Buff Padrono Chamois).

ANY DISTINCT VARIETY NOT BEFORE MENTIONED.—First, Rev. J. S. Lowndes, Hartwell, Aylesbury (Andalusian). Second, J. K. Fowler (Friedzed Niggers). Highly Commended, Mrs. E. Terry jun., Aylesbury (Niggers).

DUCKS (Rouen).—First, J. K. Fowler. Second, Rev. J. S. Lowndes.

Third, Hon. Mrs. A. Baillie Hamilton. Highly Commended, Mrs. Farquharson, Towcester.

DUCKS (Aylesbury).—First and Second, Mrs. Seamons. Third and Highly Commended, J. K. Fowler.

DUCKS (Any other variety).—First, T. C. Harrison, Hull. Second, J. N. Beasley, Braintree, Northamptonshire (Ruenos Ayres). Highly Commended, J. H. Roper (Mandarin); C. N. Baker, Chelsea, (Mandarin). Commended, J. H. Roper (Carolina).

TURKEYS (Any variety).—First, J. N. Beasley. Second, J. Tompkins, Southcott, Leighton Buzzard.

GEESSE (Any variety).—First, Mrs. Seamons. Second, J. K. Fowler.

PHEASANTS (Any variety).—Prize, J. K. Fowler (Gold). Highly Commended, B. S. Lowndes (Gold); E. Bassett, Leighton Buzzard (Silver); M. Leno (Golden); R. Richmond. Commended, J. K. Fowler (Silver); Rev. H. C. Russell, Wentworth Vicarage, Rotherham (Golden).

GAME BANTAMS.—First, Cup, and Second, W. B. Jeffries (Black Reds). Third, C. H. Raynor. Highly Commended, F. Gatto; W. Thurgill, Bedford (Black Reds); J. Allen, Amptill. Commended, J. Laming, Cowburn, Spalding (Black Reds); T. C. Harrison; W. G. Johnson, Bedford (Duckwing).

BANTAMS (Any variety).—First and Second, M. Leno (Laced). Third, S. & K. Ashton (Black). Highly Commended, T. C. Harrison; U. Spary (Gold-laced). Commended, J. N. Beasley (Japanese Frizzled); Rev. F. Tearle, Newmarket (White).

SINGLE COCKS.

GAME (Any variety).—First, R. Hall. Second, A. C. Swain, Radeline, Buckingham. Highly Commended, E. Shaw, Plas Wilnot, Oswestry.

DORKINGS (Any variety).—First, J. H. Roper, Barham. Second, Rev. E. Bartram, Great Berkhamstead. Highly Commended, Rev. E. Bartram; J. Longland. Commended, F. Gatto, Leighton Buzzard.

COCHIN-CHINA (Any variety).—First, J. H. Beasley, Erampton. Second, J. K. Fowler. Commended, H. Dean, Southam, Warwickshire (White); J. Longland.

BRABIA Pootra (Dark or Light).—First and Second, Hon. Miss E. Douglas Pennant. Commended, H. Dean, Southam, Warwickshire (Light); J. K. Fowler.

BANTAMS (Any variety).—First, U. Spary (Silver-laced). Second, M. Leno. Highly Commended, W. B. Jeffries (Black Reds); G. Shrimpton (Black Reds); Rev. F. Tearle; J. K. Fowler; G. H. Raynor, Tonbridge; J. Allen, Amptill; M. Leno.

PIGEONS.

CARRIERS (Any colour).—First, H. Yardley, Birmingham. Second, J. W. Edge, Birmingham.

POUTERS (Any colour).—First and Second, F. Gresham, Sheffield (White and Red). Highly Commended, E. Brown, Sheffield; F. Gresham (Red and White). Commended, F. Gresham (Black).

TUMBLERS (Almond).—First, E. Brown. Second, H. Yardley.

TUMBLERS (Any other variety).—First, J. W. Edge. Second, H. Yardley. Highly Commended, W. H. Denison, Woburn Sands (Kite).

JACOBIANS (Any colour).—First, W. H. Denison (Yellow). Second, E. Brown (Red). Highly Commended, J. W. Edge. Commended, H. Yardley.

FANTAILS (Any colour).—First, H. Yardley. Second, Mrs. Seamons. Highly Commended, W. H. Denison; J. W. Edge.

TRUMPETERS (Any colour).—First, W. H. Denison (Mottled). Second and Third, Rev. H. C. Russell (White).

TURBITS (Any colour).—First, J. W. Edge. Second, T. P. Willis, Winslow. Highly Commended, E. Brown.

BARBS (Any colour).—First, H. Yardley. Second, E. Brown. Highly Commended, W. H. Denison. Commended, J. H. Roper.

MAGPIES (Any colour).—Prize, J. W. Edge.

JUDGE.—E. Hewitt, Esq., Sparkbrook, Birmingham.

NORTH BRITISH COLUMBIAN SOCIETY'S SHOW.—DEC. 10TH AND 11TH.

"WILTSHIRE RECTOR" informs us that this Exhibition is, when compared to other Pigeon shows, what the poultry Exhibition of Birmingham is to other poultry shows. We are promised some relative notes by him, so this week only publish the list of awards.

EXTRA PRIZES.

The Members' Challenge Cup (value £30) presented by the Society to the most successful Exhibitor in 1866, 1867, and 1868. Gained in 1866 by J. Montgomery, Belfast; in 1867 and 1868 by R. Fulton, Deptford; finally awarded to J. Montgomery, being the most successful Competitor during the three-years contest.

A Silver Medal presented by W. Volkman, Esq., as a Special Prize, for excellence of form and carriage, open to all the Cock Pouters in the standard Pied Classes, of not less measurement than 18½ inches in feather, and 6½ inches in limb. Fair colour and markings indispensable.—R. Fulton.

A Silver Medal presented by W. Volkman, Esq., for excellence of colour and marking; open to all the Cock Pouters in the standard Pied Classes, of good form and carriage, and of not less measurement than 18½ inches in feather, and 6½ inches in limb.—James Montgomery.

A Silver Medal presented by George Ure, Esq., as a Special Prize, to the best Pouter Hen in the Exhibition.—R. Fulton.

EXTRA CLASSES.

POUTERS (Black Pied).—*Young*.—Silver Medal presented by J. Muir, Esq., R. Fulton, Deptford. Second prize given by a Member, J. Macfarlane, Tolleross. Very Highly Commended, J. Macfarlane. Highly Commended, J. Montgomery. Commended, R. Fulton.

POUTERS (White).—*Young*.—Silver Medal presented by M. Sanderson, Esq., R. Fulton. Second Prize given by a Member, D. Stewart, Perth. Very Highly Commended, J. Montgomery. Highly Commended, R. Fulton. Commended, A. Heath, Cairne.

POUTERS (Blue Pied).—*Young*.—Silver Medal presented by W. Geddes, Esq., and Mr. Volkman's Silver Medal for excellence of colour and marking, J. Montgomery. Second prize given by a Member, R. Fulton. Very Highly Commended and Highly Commended, R. Fulton. Commended, E. Horner, Harewood, Leeds.

POUTERS (Red Pied).—*Young*.—Silver Medal presented by J. A. Thomas,

Esq., H. Brown, Walkley. Second and Very Highly Commended J. Montgomery. Highly Commended, R. Fulton. Commended, G. Ure, Dundee.

POUTERS (Yellow Pied).—*Young*.—Silver Medal presented by H. Hutchinson, Esq., R. Fulton. Second prize given by a Member G. Ure. Very Highly Commended and Commended, R. Fulton. Highly Commended, J. Montgomery.

POUTERS (Mealy Barred).—*Young*.—Silver Medal presented by W. Lightbody, Esq., R. Fulton. Second prize given by a Member, J. Macfarlane. Very Highly Commended, D. Stewart. Highly Commended, J. Montgomery.

CARRIERS (Black).—*Young*.—Silver Medal presented by J. Wallace, Esq., Glasgow, R. Fulton. Second prize given by a Member, J. Montgomery. Very Highly Commended, W. Massey, Spalding. Highly Commended, R. Fulton. Commended, J. Wallace, Burnbank.

CARRIERS (Dun).—*Young*.—Silver Medal presented by C. M. Roys, Esq., Rochdale, G. C. Holt, Lawton, Cheshire. Second prize given by a Member, R. Fulton. Very Highly Commended, J. Montgomery. Highly Commended, S. Harding, Farnham. Commended, R. Fulton.

CARRIERS (Any age).—Silver Cup presented by F. T. Wiltshire, Esq., Croydon, R. Fulton. Second, G. C. Holt. Very Highly Commended. Highly Commended, and Commended, R. Fulton.

TUMBLERS (Short-faced).—*Young*.—Silver Medal presented by J. H. Frame, Esq., Overton, R. Fulton. Second prize given by a Member, R. Fulton. Very Highly Commended, J. Montgomery. Highly Commended and Commended, R. Fulton.

BARBS (Young).—Silver Medal presented by M. Stuart, Esq., Glasgow, J. Montgomery. Second prize given by a Member, J. Montgomery. Very Highly Commended and Commended, R. Fulton. Highly Commended, E. Horner.

POUTERS (Black).—*Cocks*.—First and Highly Commended, R. Fulton. Second, J. Macfarlane. Third and Commended, J. Montgomery.

POUTERS (Black Pied).—*Hens*.—First and Commended, R. Fulton. Second, Third, and Highly Commended, J. Montgomery.

POUTERS (White).—*Cocks*.—First, D. Stewart. Second and Commended, R. Fulton. Third, J. Montgomery. Highly Commended, J. Grant, Edinburgh. *Hens*.—First, and Mr. Ure's Silver Medal for best Pouter Hen, R. Fulton. Second, G. Ure. Third, G. Montgomery. Highly Commended and Commended, A. B. Boyd, Edinburgh.

POUTERS (Blue Pied).—*Cocks*.—First, Second, and Third, and Mr. Volkman's Silver Medal for excellence of form and carriage, R. Fulton. Highly Commended, J. Montgomery. Commended, D. Stewart. *Hens*.—First and Highly Commended, J. Montgomery. Second and Commended, R. Fulton. Third, J. Huie, Crosshill, Glasgow.

POUTERS (Red Pied).—*Cocks*.—First, Second, Third, Highly Commended, and Commended, J. Montgomery. *Hens*.—First, Second, and Highly Commended, J. Montgomery. Third, G. Ure. Commended, R. Fulton.

POUTERS (Yellow Pied).—*Cocks*.—First, Third, and Commended, J. Montgomery. Second, R. Fulton. Highly Commended, W. Volkman. *Hens*.—First, G. Ure. Second, Highly Commended, and Commended, J. Montgomery. Third, R. Fulton.

POUTERS (Mealy Barred).—*Cocks*.—First, Second, and Highly Commended, J. Montgomery. Third, J. Ruthven, Pollockshields, Glasgow. Commended, R. Fulton. *Hens*.—First, Second, and Highly Commended, J. Montgomery. Third, R. Fulton. Commended, W. R. Rose, Cransley Hall, Kettering.

POUTERS (Irregular in colour and Marking).—*Cocks*.—First and Second, J. Montgomery. Third and Commended, F. K. Ir, Edinburgh. Highly Commended, J. McGill, Elic. *Hens*.—First, Highly Commended, and Commended, J. Montgomery. Second and Third, R. Fulton.

CARRIERS (Black).—*Cocks*.—First, Second, Third, Highly Commended, and Commended, R. Fulton. *Hens*.—First, Second, Third, and Commended, R. Fulton. Highly Commended, J. Montgomery.

CARRIERS (Dun).—*Cocks*.—First, J. Montgomery. Second, Third, Highly Commended, and Commended, R. Fulton. *Hens*.—First and Highly Commended, J. Montgomery. Second, Third, and Commended, R. Fulton.

CARRIERS (Any colour, Black and Dun excepted).—First and Highly Commended, R. Fulton. Second, Third, and Commended, J. Montgomery.

SHORT-FACED TUMBLERS (Almond).—First, Second, Highly Commended, and Commended, R. Fulton. Third, J. Montgomery.

SHORT-FACED TUMBLERS (Mottled, Agates, Kites, and Self-colours).—First, Second, and Third, R. Fulton. Highly Commended, J. Montgomery. Commended, F. Graham, Birkenhead.

BARBS (Black).—Silver Medal, presented by J. Ruthven, Esq., Glasgow, R. Fulton. Second and Third, R. Fulton. Highly Commended, J. Montgomery. Commended, W. B. Van Haansbergen, Newcastle-on-Tyne.

BARBS (Any colour, Black excepted).—Silver Medal, presented by G. White, Esq., Paisley, R. Fulton. Second, R. Fulton (Yellow). Third, E. Horner. Highly Commended and Commended, J. Montgomery.

FANTAILS.—Silver Medal, presented by F. Elze, Esq., London, J. Montgomery. Second, R. Fulton. Third, A. Smith, Boughty Ferry. Highly Commended, W. R. Park, Melrose. Commended, J. Sharp, Johnstone.

JACOBIANS (Red or Yellow).—Silver Medal, presented by J. Huie, Esq., Glasgow, E. Horner. Second and Third, E. Horner. Highly Commended, J. Montgomery. Commended, A. B. Boyd (Red).

JACOBIANS (White or Black).—Silver Medal, presented by J. Sharp, Esq., Johnstone, E. Horner. Second and Third, J. Montgomery. Highly Commended, R. Fulton (Black). Commended, J. Montgomery.

TRUMPETERS (White or Black).—Silver Medal, presented by Capt. Heaton, Manchester, J. Montgomery (Black). Second, J. Montgomery. Third, A. B. Boyd (White). Highly Commended, J. Wallace. Commended, G. White (Black).

TRUMPETERS (Mottled).—Silver Medal, presented by A. B. Boyd, Esq., Trinity, E. Horner. Second, Third, and Commended, J. Montgomery. Highly Commended, W. H. Johnson.

TURBITS.—Silver Medal, presented by J. R. Rennards, Esq., Helensburgh, R. Fulton. Second, R. Fulton. Third, J. Montgomery. Highly Commended, H. Yardley, Birmingham. Commended, E. Horner.

OWLS (English).—Silver Medal, presented by Capt. Heaton, Manchester, F. Sale. Second, C. Balpin, Bridgewater. Third, J. Crossland, jun., Wakefield. Highly Commended, J. Firth, Webster Hill, Dewsbury. Commended, W. R. Park.

OWLS (Foreign).—First and Second, R. Fulton. Third and Highly Commended, J. Montgomery. Commended, Miss F. Easton, Hull.

DRACOONS.—First, J. Montgomery. Second and Third, R. Fulton. Highly Commended, H. Yardley. Commended, J. Wallace.
NUNS.—First, J. Montgomery. Second, E. Horner. Third, J. Sharp. Highly Commended, W. B. Van Haansbergen. Commended, H. Yardley.
TUMBLERS (Beard or Balds).—First, W. H. C. Oates, Bosthorpe, Newark. (Blue Beards). Second and Highly Commended, R. Fulton. Third, F. Graham (Beards). Commended, J. Ruthven (Balds).
FANCY, NOT OTHERWISE CLASSED.—First and Highly Commended, J. Montgomery (Magpies and Lace Pantalons). Second, H. Yardley. Third, J. Wallace (Luhores). Commended, E. Horner.

JUDGES.—Dena Wolstenholme, Esq., London; F. Esquilant, Esq., London; James Miller, Esq., Glasgow.

ROYAL DUBLIN SOCIETY'S POULTRY SHOW.

DECEMBER 8TH, 9TH, AND 10TH.

THE Show of poultry far exceeded, both in the number and quality of birds exhibited, any of its predecessors. 330 pens in all were shown, and, as will be seen from the prize list, a considerable number came across the water to compete for the laurels in the Green Isle.

In *Silver-Grey Dorkings*, Mrs. Warburton stood first with a pen that could hold their own anywhere; the same may be said of her prize pen in the Coloured class, while in chickens she had it all her own way; the second-prize pen in the old Coloured class was also very good. In the single cocks the competition was very close, sixteen birds of first-rate quality being shown, but the honours were fairly won by Mr. Barlow, with a most promising young bird.

In *Spanish*, Miss Douglas Pennant heads the list; the quality of her birds is too well known to require comment. In the old class Mr. Cooper stood a good second; while in both the chicken classes Miss Drevar showed birds which, if they had seen as many mouths as Miss Pennant's, might have wrested their honours from them.

The *Brahmas* came to the front in great force—forty-one pens in all. Mrs. Barrell gained most honours; next came Mrs. Warburton and Mr. Boyle. This class was of first-rate quality, and by its numbers augurs well for the prospects of these deservedly popular birds in this country.

Mrs. Barrell took all the firsts in *Cochins*. The cock in her old pen was notably one of the best Buff Cochins we have ever seen. The title to second honours in this class was so evenly balanced between Mr. Staunton's Partridges and Mr. Zurhorst's Whites that the Judges determined to award them equal seconds.

In *Game*, some birds of the true type were shown. Mr. Staunton stood first with a beautiful pen of Black Reds; while Mr. McClinton showed a nice pen of chickens. In both classes of *Hamburghs* the prizes were won by birds of real merit; but, on the whole, there was a great deficiency in the markings, &c., which leaves decided room for improvement.

Of Miss De Courcy Drevar's White-crested fowl we cannot speak too highly; they could hold their own anywhere.

In French fowl, the La Flèche were but poorly represented, although the winners were of fair quality. In *Crève-Cœur*s the real contest lay between Mr. Cooper and Mr. Zurhorst; and, although the Judges decided in favour of the former gentleman, the birds of the latter were by most thought superior; however, they were both exceedingly fine. The *Houdans* were well represented; Mr. Pim taking first with a very fine pair.

In the Variety class the first prize went to a good pen of Silver-crested Poland; the second to a nice lot of Sultans.

Bantams showed pretty fairly, considering that this is the first time they have been favoured with a class; but the strong points of the Show were the Geese and Ducks; of the former there were twenty entries, all good; in the latter, thirty-six. Mr. Williams carried off the palm for Geese and Rouen Ducks, while Mrs. Barrell stood first in Aylesbury. The Turkeys, with the exception of the cock in the first-prize pen, were only of average quality.

The show of *Pigeons* was small, and included nothing noteworthy, except perhaps a pen of Ice Pigeons and one of Isabels belonging to Mr. McCrean.

The arrangements, &c., were carried out by Mr. Andrew Corrigan, the Agricultural Superintendent, and were exceedingly good, especially when we consider that the entries only closed six days before the Show. Subjoined is the prize list:—

DORKINGS (Silver-Grey).—First, Third, and Commended, Mrs. Warburton, Kill, Naas. Second, S. Mowbray, Killeary, Mountrath. Highly Commended, J. C. Cooper. *Chickens*.—First and Second, Mrs. Warburton. Highly Commended, T. Franks, Mallow. Commended, Mrs. Warburton; S. Mowbray.

DORKINGS (Coloured).—First, Mrs. Warburton (Dark). Second and Third, R. P. Williams, Glaslinn, Clontarf. Highly Commended, Mrs. Hay, Co. Cork. Commended, J. C. Cooper. *Chickens*.—First, Mrs. Warburton (Dark). Second and Highly Commended, J. C. Cooper, Limerick. Commended, R. P. Williams.

SPANISH.—First, Hon. Miss Douglas Pennant, Pearhyn Castle, Bangor. Second, J. C. Cooper. Commended, G. A. Stephens, Dublin. *Chickens*.—First, Hon. Miss Douglas Pennant. Second, Miss De Courcy Drevar, Rose Hill, Blackrock, Co. Dublin. Commended, R. P. Williams.

BRAMA POOTRA.—First, Mrs. Warburton (Dark). Second, Hon. J. Massey, Limerick (Dark). Highly Commended, Mr. Warburton; Capt. Downham. Commended, J. C. Cooper. *Chickens*.—First, Mrs. Barrell, Stoke Park, Ipswich. Second, R. W. Boyle. Highly Commended, Hon. Miss Douglas Pennant. Commended, R. W. Boyle.

COCHIN-CHINAS.—First, Mrs. Barrell. Equal Second, F. W. Zurhorst; C. F. Staunton, Clondalkin (Partridge-coloured). Highly Commended,

F. W. Zurhorst. Commended, J. C. Cooper. *Chickens*.—First, Mrs. Burrell. Second and Highly Commended, F. W. Zurhorst (White). Commended, C. F. Staunton.

GAME.—First, C. F. Staunton (Black-breasted Reds). Second, J. C. Cooper. Highly Commended, C. E. McClinton. Commended, J. C. Cooper; Hon. J. Massey, Limerick. *Chickens*.—First, C. E. McClinton, Randsdown, Co. Antrim. Second, F. W. Zurhorst.

HAMBURGONS (Pencilled).—First, Mrs. Burrell. Second, J. C. Cooper. Highly Commended, Hon. J. Massey. Commended, C. E. McClinton.

HAMBURGONS (Spangled).—First, C. F. McClinton. Second, S. Mowbray. Highly Commended, W. Helm, Dublin. Commended, F. Zurhorst; S. Mowbray.

WHITE-CRESTED BLACK, OR BLACK-CRESTED WHITE.—First and Second, Miss De Courcy Drevar (White-crested Black). Highly Commended, R. P. Williams; J. K. Milner, Dublin.

LA FLECHE.—First, J. C. Cooper. Second and Highly Commended, G. A. Stephens.

HOUDANS.—First, F. W. Pim, Greenmount, Harold's Cross, Dublin. Second, J. C. Cooper. Highly Commended, Hon. J. Massey. Commended, Mrs. Burrell; J. C. Cooper.

CRÈVE-CŒUR.—First, J. C. Cooper. Second, F. W. Zurhorst. Commended, J. C. Cooper.

ANY OTHER VARIETY NOT COMPETING IN THE FOREGOING SECTIONS.—First, Mrs. Burrell (Silver-spangled Poland). Second and Commended, J. C. Cooper (Sultans and Courte Pantes). Highly Commended, F. W. Pim (Silver Poland); Countess of Charlemont, Fairview (Golden Pheasants).

GAME BANTAMS (Any variety).—First, F. W. Zurhorst. Second, G. F. D. Sutherland (Black Red). Highly Commended, F. W. Zurhorst.

ANY OTHER VARIETY.—First, Mrs. Staunton (Black Bantams). Second, Mrs. G. Perrin, Loughlinstown (Nankin Bantams). Highly Commended, Mrs. Clay (White Rose-combed Bantams). Commended, F. W. Zurhorst (Black Bantams).

TURKEYS.—First, F. W. Zurhorst. Second and Third, J. C. Cooper. Highly Commended, L. King, Genshill. Commended, J. C. Cooper.

POULTS.—First and Second, J. C. Cooper. Commended, S. Mowbray. *Cock*.—First, J. C. Cooper. Second, F. W. Zurhorst. Commended, J. C. Cooper; Hon. J. Massey.

GEES.—First, R. P. Williams (Toulouse). Second and Third, Mrs. Warburton. Highly Commended, J. C. Cooper. Commended, J. Burke; Hon. J. Massey.

DUCKS (Rouen).—First and Second, R. P. Williams. Highly Commended, R. W. Boyle; H. M. Barton, Dundrum. Commended, S. Mowbray; J. Barlow.

DUCKS (Aylesbury).—First, Mrs. Barrell. Second, R. P. Williams. Highly Commended, Mrs. Warburton. Commended, W. Magrath; Mrs. Warburton.

SINGLE COCKERELS.

DORKING.—First, J. Barlow, Chapelized (Grey). Second, W. Magrath, Blesinton (Silver-Grey). Highly Commended, Mrs. Warburton; S. Mowbray. Commended, J. C. Cooper; T. Felton, Fairview.

SPANISH.—First, Hon. Miss Douglas Pennant. Second, Miss De Courcy Drevar.

COCHIN-CHINA.—First, Mrs. Barrell. Second, J. K. Milner, Charbury, Blackrock, Co. Dublin.

BRAMA POOTRA.—First, Mrs. Barrell. Second, J. Bourke, Stapolin, Baldylee. Highly Commended, Mrs. Warburton; G. A. Stephens; Hon. Miss D. Pennant; Major Bacon, Dublin.

LA FLECHE.—First, G. A. Stephens, Dublin. Second, J. C. Cooper.

HODDAN.—First, Mrs. R. Clay, Anglesey. Second and Highly Commended, J. C. Cooper.

CRÈVE-CŒUR.—First and Second, J. C. Cooper.

GAME.—First, J. W. Sutherland, Carrickmines, Co. Dublin. Second, F. W. Zurhorst. Highly Commended, J. C. Cooper. Commended, C. E. McClinton.

PIGEONS.—*Carriers*.—Cock.—Prize, E. McCrean, Stillorgan. *Hen*.—Prize, E. McCrean. *Tumblers* (Any breed).—First, E. McCrean (Kite). Second, Mrs. G. Perrin. *Fantails*.—First, N. Evans, Dublin. Second, Miss Arthur. Commended, E. McCrean. *Any other variety not before mentioned*.—First, second, and Third, E. McCrean (Siberian Ice). Commended, J. Lloyd, Cork; E. McCrean.

The Judges were Messrs. P. H. Jones, of Fulham, London; W. G. Merry, of Blessinton; and A. Comyns, jun., of Glenageary, Co. Dublin; and we may add that their awards gave, with few exceptions, entire satisfaction.

LEEDS POULTRY SHOW.

This was held on the 12th, 14th, and 15th inst. The following is the prize list:—

GAME (Black-breasted Red).—First, E. Aykroyd, Bradford. Second, R. Booth, Halifax. Third, T. Lambert, Silsden. *Chickens*.—First, S. Moore, Keighley. Second, E. Aykroyd. Third, J. Rollinson, Otley.

GAME (Brown-breasted and other Red, except Black-breasted).—First, M. Graham, Kendal. Second, W. Bentley, Scholes, Cleckheaton. Third, A. K. Briggs, Bradford. *Chickens*.—First and Cup, F. Sales, Crowle. Second, H. Jowett, Idle. Third, R. Payne, Brierfield.

GAME (White and Piles).—First, R. Butcher, Chesterfield. Second, R. Turner, Drighlington. Third, T. I. Sunderland, Halifax. *Chickens*.—First, H. C. & W. T. Mason, Drighlington. Second, R. Butcher. Third, G. Pounder, Kirby Moorside.

GAME (Any other variety).—First, W. Boves, Beverley. Second, E. Aykroyd. Third, J. Fortune, Keighley. *Chickens*.—First, H. Jowett, Leeds. Second, H. C. & W. T. Mason. Third, P. Ashworth, Halifax.

DORKINGS (Silver Grey).—Third, H. Beldon, Bingley. *Chickens*.—First, J. Stott, Rochdale. Second, Rev. E. S. Tiddeman, Brentwood.

DORKINGS (Any other variety).—First, H. Beldon. Second, T. Rogers, St. Helen's, Lancashire. Third, J. Elgar, Newark. *Chickens*.—First and Cup, J. White, Northallerton. Second, J. Stott. Third, H. Beldon.

SPANISH.—First and Cup, Hon. Miss Douglas Pennant, Bangor. Second, H. Beldon. Third, W. A. Taylor, Manchester. *Chickens*.—First, H. Beldon. Second, Birch & Boulter, Sheffield. Third, W. & F. Pickard, Thorne.

COCHIN-CHINA (Cinnamon and Buff).—First, W. A. Taylor. Second, G. H. Proctor, Durham. Third, J. H. Dawes, Birmingham. *Chickens*.—

First, W. A. Taylor. Second, R. White, Sheffield. Third, C. Sedgwick, Keighley.

COCHIN-CHINA (Any other variety).—First, T. M. Derry, Wisbeach. Second, C. Sedgwick. *Chickens*.—First and Cup, W. A. Taylor. Second, E. Shaw, Oswestry. Third, R. White.

BRAMA POOTRAS.—First, E. Leach, Rochdale. Second, W. Whiteley, Sheffield. Third, J. Walker, Knarborough. *Chickens*.—First and Cup, E. Leach. Second, Hon. Miss Douglas Pennant. Third, W. Whiteley.

HAMBUROS (Golden-pencilled).—First, W. Harker, Allerton, Bradford. Second, H. Beldon. Third, S. Smith, Northwam. *Chickens*.—First, H. Beldon. Second, W. Harker. Third, S. Smith.

HAMBUROS (Silver-pencilled).—First and Third, H. Beldon. Second, J. Walker, Knarborough. *Chickens*.—First, H. Beldon. Second, W. Pitts, Bingley. Third, B. Bee, Preston.

HAMBUROS (Golden-spangled).—First, G. Pounder, Kirby-Moorside. Second, H. Beldon. Third, J. S. Senior, Dewsbury. *Chickens*.—First and Cup, J. Ogden, Manchester. Second, F. Greenwood, Rochdale. Third, T. May, Wolverhampton.

HAMBUROS (Silver-spangled).—First and Second, H. Beldon. Third, J. Walker. *Chickens*.—First, H. Beldon. Second, T. Robinson, Baildon. Third, J. Walker.

HAMBUROS (Black).—First, C. Sedgwick, Keighley. Second, H. Beldon. Third, S. Butterfield, Keighley. *Chickens*.—First, Mason & Walker, Manchester. Second, H. Beldon. Third, F. Fitton, jun., Oldham.

POLANDS (Any variety).—First, J. S. Senior. Second and Third, H. Beldon. *Chickens*.—First and Third, H. Beldon. Second, J. S. Senior.

FARMYARD CROSS, OR ANY OTHER VARIETY NOT PREVIOUSLY CLASSED.—First, H. Beldon. Second, R. Loft, Beverley. Third, J. J. Waller, Kendal.

SELLING CLASS.—First, J. Berry, Silsden. Second, W. A. Taylor. Third, C. Sedgwick.

BANTAMS (Black).—First, R. B. Riley, Halifax. Second, H. Beldon. Third, Tomkins & Tuckey, Bristol.

BANTAMS (White).—First, W. A. Taylor. Second, S. & R. Ashton, Cheeshire. Third, W. H. Tomlinson, Newark.

GAME BANTAMS.—Cnp, First, and Third, J. Crosland, jun., Wakefield. Second, W. J. Bamber, Accrington.

BANTAMS (Any other variety).—First, T. C. Harrison, Hull. Second, T. Burgess, Brighouse. Third, J. Wilkinson, Tyersall Hall.

TURKEYS.—First and Second, J. B. Braithwaite, Northallerton. Third, Col. St. Ledger, Rotherham.

GEESSE (White).—First, E. Leach, Rochdale. Second, J. B. Braithwaite. Third, S. H. Stott.

GEESSE (Grey and Mottled).—First, E. Leach. Second, Lord Wenlock, Eacrick Park. Third, S. H. Stott.

DUCKS (Aylesbury).—First, E. Leach. Second, G. A. Crews, Derby. Third, J. Hutchinson, Cowling, Crossbills.

DUCKS (Rouen).—First, J. Dixon, Bradford. Second, J. J. Waller. Third, J. White, Wakefield.

DUCKS (Any other variety).—First, J. Dixon. Second, T. C. Harrison, Hull. Third, H. Beldon.

COUPLE OF DRESSED FOWLS FOR THE TABLE.—First, H. Dowsett, Chelmsford. Second, W. Ward, Leeds.

DRESSED TURKEY.—First, W. Ward. Second, W. Hobson, Leeds.

SINGLE COCKS.

GAME (Any description).—First, W. Spencer, Haworth. Second, R. Payne, Burnley. Third, W. Boyes, Beverley.

DORKING (Any description).—First, Rev. G. Hustler, York. Second, J. White. Third, J. F. Newton, Kirby-in-Cleveland.

SPANISH.—First, M. Turnbull, jun., Melrose. Second, J. Newton. Third, H. Beldon.

COCHIN-CHINA.—First, W. A. Taylor. Second, C. Sedgwick. Third, J. H. Dawes, Birmingham.

BRAMA POOTRA.—First, E. Leach. Second, Hon. Miss Douglas Pennant, Bangor. Third, J. F. Newton.

HAMBUROS (Any variety).—First, Hepworth & Coldwell, Holmfirth. Second, B. Bee, Preston. Third, W. H. Bentley.

PIGEONS.

CARRIERS.—First and Cnp, E. Walker, Leicester. Second, E. Horner, Harewood. Highly Commended, E. Walker; G. Charuley, Preston; P. J. Leach, Middlesbrough; J. Chadwick, Bolton.

PORTERS.—First, C. Cowburn, Leeds. Second, E. Horner. Highly Commended, J. Hawley, Bingley; W. C. Dawson, Otley; J. T. Lishman, Bradford.

TUMBLERS (Short-faced).—First, J. Hawley. Second, F. J. Leach. Highly Commended, J. Hawley; C. Cowburn; T. C. & E. Newbitt, Epworth; T. Ryle, Durham; F. J. Leach.

TUMBLERS (Any other variety).—First, J. Fielden, Rochdale. Second, J. Hawley. Commended, W. Lund, Shipley; F. J. Leach.

OWLS.—First, J. Fielden. Second, W. C. Dawson. Highly Commended, J. Fielden; J. Chadwick; J. T. Lishman.

FANTAILS.—First and Second, T. C. & E. Newbitt. Highly Commended, J. Hawley; H. Draycott, Leicester; J. Hawley. Commended, W. R. Park, Melrose.

BARS.—First, F. J. Leach. Second, E. Horner. Highly Commended, E. Horner; J. Firth, Dewsbury.

TURBOTS.—First, R. Patters, Melrose. Second, W. R. Park. Highly Commended, J. Thompson, Bingley; J. A. Naylor. Commended, J. Thompson; J. Hawley; S. Simpson.

JACOBS.—First and Second, C. Cowburn. Highly Commended, J. Thompson. Commended, J. Hawley.

TRUMPETERS.—First, E. Horner. Second, S. Robson, Brotherton. Highly Commended, J. Firth; E. Horner; F. J. Leach.

NUNS.—First, F. J. Lishman. Second, Miss F. Easton, Hull. Highly Commended, W. Croft, Killinghall, Yorks; F. J. Leach; J. A. Naylor. Commended, H. Yardley.

DRAGONS.—First, W. Moore, Keighley. Second, J. Baxendale. Highly Commended, C. Cowburn; R. Marshall, Manchester; S. Smith, Keighley; J. Chadwick, Bolton; E. Butterworth, Nantwich; R. Wilson.

ANTWERPS.—First and Second, W. Lund, Shipley. Highly Commended, E. Horner; J. Hawley; J. Crosland, Wakefield; J. Wilkinson, Bradford; W. H. Mitchell. Commended, J. S. Senior.

MAGPIES.—First, E. Horner. Second, F. J. Leach. Highly Commended, E. Horner. Commended, W. C. Dawson; J. Lishman.

ANY OTHER VARIETY.—First, W. C. Dawson. Second, H. Draycott.

Highly Commended, J. Hawley; W. C. Dawson; H. Yardley; H. Draycott; J. T. Lishman; J. Trenam. Commended, E. Horner; W. Shaw, York.

RABBITS.

YELLOW AND WHITE, AND TORTOISESHELL.—First, F. Stainburn, York. Second, T. Ingham, Leeds.

BLACK AND WHITE.—First, C. King, London. Second, J. Dixon.

SELF-COLOURED.—First, R. Dobson, York. Second, H. Yardley.

GREY AND WHITE.—First and Silver Medal, J. Ingham. Second, C. King.

DOE AND YOUNG ONES (the young ones to be under one month old, of any variety).—First, S. Harcastle, York.

Mr. Edward Hewitt, Birmingham, and Mr. Richard Teabay, Preston, were the Judges for *Poultry*; Mr. James Dixon, Bradford, for *Pigeons*; and Mr. A. Cattley, of York, for *Rabbits*.

THE ASHFORD AND EAST KENT POULTRY SHOW.

THE gale of the 5th inst. severely tried the huge canvas erections in which a large portion of the poultry and animals for the above exhibition had by the close of the evening been penned. Men were watching the marques all night, and notwithstanding that one or two breaches were made in the canvas all was kept secure until morning, by which time the gale had abated. On Sunday evening, however, the wind again arose, and by eleven o'clock a perfect hurricane was blowing from the south-west, and soon the Cattle Show building began to yield to the pressure upon it, and in the course of a short time the canvas was blown to ribbons, and the beams were broken and destroyed. The Poultry Show building stood longer, but at last that, too, succumbed, and the canvas and internal gear being blown about, every now and then knocked down and broke the pens, liberating many of the birds, so that occasionally from fifty to a hundred were running about at one time. Mr. G. Foord, the Secretary of the Shows, with Dr. Beet and other gentlemen of the town, who had been called up, exerted themselves to the utmost to get the birds out of the exposed pens, and secure those which were running loose. The birds were replaced in hampers and boxes and conveyed to the Corn Exchange for shelter. The roof of a booth containing the Geese and Turkey classes was blown down entire, and the canvas fell on the pens, so that the birds had to be got out from underneath. In the morning the place was a scene of complete devastation, and it seemed doubtful whether a show of Poultry could take place, whatever efforts might be made to repair the damage. The energy of the Secretary, Mr. George Foord, and of the managing committee, was quite equal to the occasion.

The Corn Exchange directors having at length yielded consent to the Poultry Show being held in their building, the committee and a number of zealous inhabitants of the town set vigorously to work to make the necessary arrangements, and notwithstanding the mixing up of birds, the destruction of tickets, and the great labour involved in removing and setting in order the pens, what seemed a well-nigh herculean task, was accomplished by six o'clock in the evening to a sufficient extent to allow of the public being admitted.

Of course, any praise bestowed on either of the shows founded on the little there was to be seen on the Saturday night would be absurd, as a large portion of the exhibits—and those the most valuable portion of them, could not be inspected until Monday evening. The great accession sent to the Poultry Show by Miss Hales, in particular, did not arrive until Saturday night. On Tuesday, however, it was apparent that but for the unfortunate occurrence above described the exertions of the managers of the Show would have been attended with a larger amount of success than ever before rewarded their exertions.

We should state the judging did not take place until Tuesday. A meeting of the Committee was held in the morning to decide what was best to be done under the circumstances. It was resolved that an endeavour should be made to keep faith with the public, and in all cases where the birds were mixed together, the entrance money should be returned. Awards were made in each class, although in one or two instances the second or third prizes could not be given, owing to doubtful ownership.

DORKINGS (Coloured).—First, F. Kipping, Meat Hall, Maidstone. Second, J. B. Plumtre, Goodnestone, Wingham. Third, Miss Hales, Canterbury. Highly Commended, W. Stutfield, Mynstole, Canterbury. *Chickens*.—First, C. Havers, Ingatestone, Essex. Third, F. Cheeseman, Chart Court Lodge. Highly Commended, J. E. Plumtre. *Cocks*.—First, Miss Hales. Second, F. Cheeseman. Highly Commended, W. Stutfield; F. W. Pittock, Sellindge.

DORKINGS (White).—First, W. Dring, Faversham. Second, — Cobb, Faversham.

SPANISH.—First, — Jenner, Lewes. Second, E. Corke, Maidstone. *Chickens*.—First, P. H. Jones, Fulham, S.W. Second, E. Corke. Highly Commended, Miss Hales. *Cock*.—First, E. Corke.

COCHIN-CHINA.—First, Finn & Culling, Faversham. Commended, J. Biggenden, East Peckham; Miss Hales; Miss Pittock, Sellindge; W. F. Harvey, Chatham.

BRAMA POOTRA.—First, E. Lawrence, Brentwood, Essex. Second, W. Dring, Faversham. Commended, Miss Hales.

GAME (Black and Brown Reds).—First, S. Matthew, Stowmarket. Second and Third, J. Jeken, Eltham, Kent. Commended, A. Wickham, Wye; Rev. G. Rayner, Tunbridge; C. F. Hore, Tunbridge. *Chickens*.—First, J. Jeken. Second, S. Matthew. Third, T. G. Ledger, Folkestone.

GAME (Any other variety).—First, Miss Hales. Second, J. Bing. *Chickens* (White).—First, S. Matthew (Duckwinged). Second, E. Rice, Sandwich (Duckwinged). Highly Commended, Lord St.

Vincout, Dodmersham Park; Miss Hales. Cocks.—First, J. Jeken. Second, Miss Hales (Black Red). Highly Commended, J. Bayley, Ashford; R. J. Sankey, Hastingsleigh.

HAMBROUS (Gold or Silver-spangled).—First, Rev. R. A. Royle, Wimbledon. Second, F. Kipping, Maidstone. Third, Miss M. A. Pitcock, Sellindge.

HAMBROUS (Gold and Silver-pencilled).—First, W. R. Tickner, Ipswich. Second and Commended, W. L. Pemberton. Third, Miss Hales.

POLISH.—First, G. W. Boothby, Louth, Lincolnshire. Second, Miss Hales. Highly Commended, P. H. Jones.

GRIVE-COEN.—First, Col. Stuart Wortley, Rosslyn House, Grove End Road. Second, W. Dring, Faversham. Third, R. J. Sankey, Hastingsleigh.

HOUBANS.—First, Col. Stuart Wortley. Second, Rev. F. Scott, Shepherds-weir Vicarage, Dover. Third, F. Elliot, Dymchurch.

BANTAMS (Gold and Silver-laced).—First, Miss Hales. Second, Miss M. E. Court, Saltwood.

BANTAMS (Black, White, or any variety).—First, H. M. Maynard, Ryde, Isle of Wight (Black). Second, G. Ware, Frant, Sussex (Frizzled). Highly Commended, R. G. Norris, Wye (Japanese).

GAME BANTAMS.—First, Rev. G. Rayner, Tonbridge. Second, Miss Hales.

DUCKS (Aylesbury).—First, E. Lawrence, Brentwood, Essex. Second, C. Havers, Ingatestone, Essex. Highly Commended, Miss Hales; W. F. Harvey, Chatham.

DUCKS (Rouen).—First, F. Parlett, Baddow, Chelmsford. Second, W. Statfield.

GESE.—First, T. Barten, Lenham. Second, Mrs. Powell, East Leatham. TERREYS.—First, T. Harvey, Ash, near Sandwich. Highly Commended, J. Barnard, Hempstead Park.

ANY OTHER DISTINCT VARIETY.—First, R. Noble, Canterbury (Silkie). Second, Col. Stuart Wortley (Frizzled). Highly Commended, Miss Hales (Andalusians and Sultans). Commended, G. M. Norris, Wye (Japanese Bantam).

PIGEONS.—Carriers.—Second, F. Elgar, Sandwich. Pouters.—Prize, W. F. Harvey, Chatham. Tumblers.—Second, F. Elgar, Sandwich. Fantails. First, H. M. Maynard. Second, Miss Hales. Highly Commended, J. Burch, Canterbury. Turbits.—First, J. Bowes, Herne Bay. Second, Miss Hales. Any other Variety.—First, F. T. Hulke, Deal (Black Barbs). Second, Miss Hales (Bagadotten). Commended, G. Ware, Frant (Mauved); Miss Hales (White African Owls and Spanish Runts).

JUDGE.—W. B. Tegetmeier, Esq., London.

TREDEGAR POULTRY SHOW.

THIS was held at Newport, Monmouthshire, on the 15th and 16th inst. We have only space this week for the following list of awards:—

GAME (Black or Brown-breasted Reds).—First and Cup, J. Fletcher Stoneclogh, Manchester. Second, H. Lee, Appuldurcombe, Isle of Wight. Third, W. Brady, Severn Navigation, Worcester. Highly Commended, J. P. Gardiner, Stonehouse, Rugby; H. Waller, Beversbrook Farm, Calne, Wilts. Commended, Rev. C. T. Salisbury, Tredunnock Rectory, Newport.

GAME (Any other variety).—First, E. Winwood, Worcester. Second, H. Lee. Third and Commended, W. Daoning, Newport, Salop. Highly Commended, G. Cole, Sea Side, Llanelli. Commended, W. Bradley.

SPANISH.—First and Cup, J. R. Rodbard, Wrington, Bristol. Second, J. Stephens, Walsall, Staffordshire. Highly Commended, T. Ace, Ystalyfera, Swansea.

DORKINGS (Any variety).—First and Commended, R. H. Nicholas, Newport. Highly Commended, H. J. Evans, Cardiff; Rev. A. K. Cornwall, Beacombe, Dursley. Commended, T. Ace.

COCHIN-CHINA (Any variety).—First and Cup, J. R. Rodbard. Second, J. Stephens. Third, H. Hobson, Walsall, Staffordshire. Highly Commended, J. Wilcox, Oswestry; Miss J. Milward, Newton St. Loe, Bristol; J. Gardiner, Bristol.

BRAHMA POOTRA (Light).—First, W. J. Craddock, Maidee, Newport. Second, H. M. Maynard, Holmswood, Ryde, Isle of Wight.

BRAHMA POOTRA (Dark).—First, W. E. Etches, Whitchurch, Shropshire. Second, Rev. J. Bowen, Llangorse Vicarage, Talgarth, Hereford. Highly Commended, H. Stephenson, Oxford; Mrs. Alsop, Worcester.

HAMBROUS (Gold pencilled).—First, J. R. Jessop, Hull. Second, H. Pickles, jun., Earby, Skipton, Yorkshire. Third, F. Pittis, jun., Newport, Isle of Wight. Highly Commended, J. Harcombe; J. Walker, Haya Park, Knaresborough. Commended, J. Harcombe, Newport; J. Pearson, Alberton, Bradford, Yorkshire.

HAMBROUS (Silver-pencilled).—First and Cup, J. Walker. Second, F. Pittis, jun., Newport, Isle of Wight.

HAMBROUS (Gold-spangled).—First, H. Pickles, jun. Second, J. Pearson. Third, N. Marlow, Denton, Manchester. Highly Commended, S. & R. Ashton, Mottram, Cheshire; W. Brady. Commended, J. R. Jessop, Hull; F. Pittis, jun.

HAMBROUS (Silver-spangled).—First, H. Pickles, jun. Second, F. Pittis, jun.

POLANDS (Any variety).—Third, Mrs. Blay, Worcester. Commended, E. M. Hutchins, Gold Tops, Newport.

HOUBANS.—First, H. M. Maynard. Second, Mrs. Blay.

ANY OTHER FRENCH VARIETY.—First, Mrs. Llewellyn, Bridgend. Second, C. Homfray, Glen Uske, Caerleon.

GAME BANTAMS.—First, H. Lee. Second, T. Davies, Newport. Highly Commended, J. Buckley, Llanelli, Carmarthen; E. Payne, Cardiff. Commended, W. Lewis, Abergavenny; F. W. Barlow, Newport; J. Laming, Cowburn, Spalding, Lincolnshire.

BANTAMS (Black—clean legged).—First and Cup, E. Cambridge, Bristol. Second, S. & R. Ashton. Highly Commended, R. H. Nicholas, Newport; H. M. Maynard. Commended, E. Cambridge, Bristol.

BANTAMS (White—clean legged).—First and Second, T. Davies, Newport.

BANTAMS (Any other variety).—First, T. Davies. Second, G. F. Hudson, Bridgwater. Highly Commended, T. C. Harrison, Hull.

ANY OTHER DISTINCT BREED.—First, Miss M. Walker, Denton, Manchester. Second, Fourth, and Seventh, R. H. Nicholas. Third, Mrs. Llewellyn. Fifth, Miss M. Walker. Sixth, J. Hinton, Hinton, Bath. Commended, Miss M. A. Barfoot, Newport.

GUINEA FOWLS.—First, Hon. F. C. Morgan, Newport.

DUCKS (Aylesbury).—First, E. Jones, Newport. Second, Right Hon.

Lord Tredegar, Newport. Commended, Rev. C. J. E. Walkey, Llantrissant Vivarage, Newport.

DUCKS (Rouen).—First, H. Garsed, Pontrych, Cardiff. Second, H. J. Evans, Cardiff. Highly Commended, J. Clond, Monmouth. Commended, W. Cooper, Abergavenny.

DUCKS (Any other variety).—First, T. C. Harrison, Hull. Second S. and R. Ashton. Highly Commended, F. C. Morgan; Rev. W. Serjeantson, GERSK.—First, Mrs. Alsop, Worcester. Second, H. Stephenson. Highly Commended and Commended, Hon. F. C. Morgan.

TERREYS.—First, Miss J. Milward, Newton St. Loe. Second, Lord Tredegar, Newport. Third, H. J. Evans, Cardiff. Commended, Hon. F. C. Morgan, Newport; R. Stallard, Drallwyn.

SELLING CLASS (for Fowls).—First and Third, R. H. Nicholas (Polands and Japanese Silkies). Second, J. Buckley, Llanelli (Dorkings). Highly Commended, R. H. Nicholas (Silver-spangled Hamburgs); C. Edwards, Pillwenny (Silver-spangled Hamburgs); Rev. J. Bowen, Llangorse Vicarage, Talgarth (Brahma Pootra); Miss J. Milward (Cochin-China); J. W. Jones, Malpas (Black Red Game); J. Skinner, Kemys Inferior, Caerleon (Dorkings); Mrs. Gordon-Canning, Hartbury (Dorkings); G. S. Sainsbury. Commended, G. Corps, Newport (Andalusians); J. Skinner (Silver-pencilled Hamburgs); C. Lyne, Bryn Hyfrid, Newport (Dorkings).

SELLING CLASS (for Ducks).—First, E. Shaw, Plas Wilmot, (Aylesbury). Second, J. M. Kilvert, Ludlow (Indian). Third, G. Thompson, Tregeors, Bridgend (Indian). Highly Commended, Rev. C. J. E. Walker, Llantrissant Vicarage, Newport (Aylesbury). Commended, G. S. Sainsbury.

SWEETSTAKES FOR COCKS.

DORKING.—Prize, Mrs. Gordon-Canning.

GAME.—First, G. S. Sainsbury. Second, J. W. Jones. Highly Commended, E. Payne, Cardiff.

COCHIN-CHINA.—Prize, E. Shaw.

GAME BANTAM.—First, E. C. Phillips, Venny Vach. Second, J. Buckley. Highly Commended, E. Payne.

ANY OTHER VARIETY.—Prize Messrs. J. J. & R. Bodmer, Gold Tops, Newport (Silver-spangled Hamburg).

PIGEONS.

CARRIERS.—First and Second, J. C. Ord, Lupas Street, London. Highly Commended, H. Yardley, Birmingham; C. Bulpin, Bridgewater. Commended, H. Yardley.

POUTERS.—First, C. Bulpin. Second, H. Draycott, Humberstone. Highly Commended, H. Yardley.

TUMBLERS.—First and Second, J. Fielding, jun., Rochdale. Highly Commended, H. Yardley.

FANTAILS.—First, H. Draycott. Second, S. Hunt. Highly Commended, H. Yardley; J. E. Breward. Commended, Rev. W. S. Shaw, Bath.

ANY OTHER VARIETY.—First, J. E. Breward (Black Swallows). Second, S. Hunt (Magpies). Third, H. Draycott (Toys). Highly Commended, H. Yardley; H. M. Maynard; C. Bulpin; H. Vaughan (Dragoons and Jacobins).

JUDGE.—Mr. E. Hatton, Pudsey, Leeds.

DISQUALIFIED PIGEONS AT THE BIRMINGHAM SHOW.

ON my arrival home this morning from visiting the Glasgow Columbarian Society's Show I found, as usual, my Journal on the dining-room table. On looking over the contents most interesting to me I was surprised to see a letter signed "CENSOR," condemning me in rather too strong language for doing what others have done, to my knowledge, for the last four years at the Bingley Hall Show. For example, in 1866 there was a pair of Short-faced Black Mottled Tumblers, exhibited by a gentleman occupying a high position, which gained a first prize. One of the birds was dyed on the head; this became apparent the day after the prizes were awarded, from the bird drinking frequently, which showed the face and round the eyes to be white. One of the judges' attention was called to the fact by an exhibitor; he merely said if he had been aware of it they should not have had a prize. The same pair of birds was shown in 1867 in a similar condition, and gained a second prize. At the same show there was a Black Pouter exhibited which had been dyed; it was detected by an exhibitor who this year has been appointed a judge. These artifices were on every occasion passed over without a single comment being made public by either the judges or visitors to the show.

I quite agree with "CENSOR" that the system of trimming, dyeing, or matching birds of the same gender for the sake of gaining an award is mean and despicable in the extreme, but where is the living fancier, including "CENSOR," who never trimmed a bird for exhibition—in so far as pairing a wry beak, cutting a hook bill, and plucking a foul feather from the bird? which I hold is as much an offence, virtually, as painting or dyeing. It is done with the same intention—namely, to deceive.

As I have already said, I have just returned from the Columbarian Show at Glasgow. I there saw several birds which had undergone a similar process, but by the hands of more skilful artists, which rendered detection more difficult. I am perfectly aware two blacks will never make one white, but why should I be set up as a target for ridicule when others are equally guilty? However, I am somewhat pleased that the castigation falls on my shoulders, as I venture to say it shall be borne with less wincing than, perhaps, by any other gentleman in the fancy.

Were I debarred from again showing as "Canson" wishes, I should not at all be annoyed at the fact, for I have, before to-day, made up my mind, with one or two exceptions annually, not to show my birds again, as I fortunately possess some of the best birds of their kind in the kingdom, and consequently prize them too much to hawk them about the country from one show to another for the sake of making a name, or getting gain, as I never entered the fancy with such intentions.

I heartily wish I may be the last miscreant thought necessary to be brought before the public for such practices, but am much afraid such will not be the case.

In conclusion, I am sorry "Canson" has not publicly given his name and address, for I have a great aversion to notice remarks from gentlemen who withhold their names.—A. H. STEWART, 124, West Street, Birmingham.

[This letter proves—if proof were necessary—that the continued practice of artifice dulls the conscience until artifice is considered venial.]

Why did Mr Stewart dye or paint his birds? Either to win a prize which he knew they were not entitled to win naturally, or to obtain from a purchaser a price he knew that purchaser would not give if not deceived by the painting.

Now, we ask Mr Stewart—we ask anyone who does the same, or who adopted any such artifice—is it not endeavouring to obtain money by false pretences?—Ers.]

PIGEON-JUDGING AT BIRMINGHAM.

I THINK "FORGIVENESS" is wrong, though I have not my catalogue by me, when he states the work was too heavy for the Pigeon Judges, and he wondered how they managed, the three having to judge 120 pens more than last year. This year I believe the entries in the Pigeons were less by about 100 pens than last year, when three did the work, and I confess felt tolerably tired at the finish. He complains of Messrs. Rippeh and Esquillant having too much in judging about 238 pens. I must differ from him here. For years Mr. Cottle and myself have judged many more pens: at the same time I am well pleased that the Council saw fit to appoint two more Judges, as it still leaves plenty to do for each, though, I think, not too much.

I shall have much pleasure in informing "FORGIVENESS" how the work was apportioned. We took the whole number of entries, and divided them as nearly as possible into two equal parts, whereupon Mr. Cottle and myself offered to take either half. Messrs. Rippeh and Esquillant chose their portion, and we took the other; but I can say that both Mr. Cottle and myself would rather have had the other half, though we only had the Almonds, Carriers, and Pouters. There were sixteen classes to judge altogether, and two silver medals to award in the Pouters. I mention this, as "FORGIVENESS" has asked the question, and I wish as much as possible that the public should know how everything is or was managed, and, to the best of our ability, with all fairness. We have nothing to hide, nor, I believe, anything to be ashamed of. And, as I have said before, I am only too pleased to be able to give the required information to "FORGIVENESS," who puts his question so courteously—by the way, almost of a postscript to his very excellent article on the Pigeons at England's great Show.—HARRISON WARR, *Widley, Essex*.

WAXEN SHEETS.

"ARCONA" in his answer to my last letter (vide page 598) has made some statements so remarkable, that for the benefit of the readers of "our Journal," as well as of himself, I feel called upon to reply.

In the first place I beg to inform him that sheets of unequal thickness are the results of bad workmanship. It is true that chance holes will be found in impressed sheets, but in plain ones they resemble those of a weaver whom I knew, who wrought a piece of cloth with many holes in it. A line of 60, being demanded for every hole, he inquired what would be required for one hole. Only "Sixpence," was the reply; when the weaver instantly rent the several holes into one. "There, now," said he, "sixpence'll do 'em now." So is it the same with the bees, in plain sheets they gnaw their many holes into one, and make short work of them. I do not think it worth while to say more on the superiority of the impressed sheets over the plain ones, since "ARCONA's" own statement fully confirms it, and I can readily see how he has been deceived by

the bees building worker instead of drone comb, although it is not for me to explain why it is so.

I regret that "ARCONA" cannot undertake to supply me with waxen sheets at about the price for which he says they can be made, as I cannot at present purchase wax for less than 8s. per lb., although I have usually bought it at from 1s. 8d. to 2s. I do not know what has caused the rise in price, but this is certain, that wax is just now in great demand.

As all sheets that I have seen sent out by Messrs. Neighbour, as well as those made by myself, weigh from fourteen to eighteen to the pound, this, with wax at 2s. to 8s. per lb., will give about 14d. to 24s. each for wax alone.

Although I may claim the honour of being the first to introduce and manufacture these sheets, and have, perhaps, made more than any one else in Scotland, I must say that I cannot at all approach the speed which "ARCONA" describes. He is certainly also in error when he describes waxen sheets as running thirty to the pound; and to settle the dispute, I beg to say that all sheets I have seen from Messrs. Neighbour and those made by myself, measuring 12½ by 7½ to 7¼ inches, weigh about sixteen to the pound, and I herewith enclose two pieces, each of them being about the eighth part of a whole sheet, for the purpose of being weighed.—A LANARKSHIRE BEE-KEEPER.

The "two" pieces of wax had multiplied to an almost indefinite number by the time they reached us. By collecting and carefully weighing the fragments we were, however, enabled to ascertain that supposing the whole of them to make up one-fourth of a sheet, it would take exactly sixteen of such sheets to weigh a pound. We have also examined the impressed wax sheets sent out by Messrs. Neighbour, which are of German manufacture, and are imported by them from the Continent. These measure 10 inches wide by 7½ deep, and run about twenty-three to the pound.

OUR LETTER BOX.

GROOVY GATE, W. Malvern.—Oatmeal is merely the flour of oats, the bran being bulled from it. Ground oats have none of the bran separated. Oats crushed as for horse feeding would be nearly or quite as good for fowls as if completely ground.

NOISE IN FOWLS' THROAT. *Heddonshire*.—It may arise from the variable weather. Give the fowls a little bread soaked in ale once daily during the winter.

TUMBLER PIGEONS. *Solihull*.—Match the Blue Bullheads, but not the Black and Blue, as the colour would be quite spoiled. There would be a good chance of their young running.

PLACE FOR KEEPING PIGEONS. *S. H. J. W.*.—Make the place as warm and free from draught as possible, and you may succeed with a few hardy birds. We recommend you to keep Trumpeters, especially as you have an eye to the table. For a full account of Fancy Pigeons and their treatment, food, &c., we advise you to obtain Brent's "Pigeon Book," free from one of our stamps. Wait till the spring before you begin Pigeon-keeping.

PIGEONS. *Carlisle*.—Drapes would suit you, they are healthy, pretty, and are untroubled fliers. Wonderful Pigeons never hurt a garden. Prices vary, but a crown would buy you a good pair, not, of course, for exhibition at any Pigeon shop. We make a rule not to recommend dealers.

FABRY SELF-WOULDED. *Arcon*.—We know no certain mode of curing a variety of plucking of the feathers if it has been in the habit of doing so any length of time. It is caused by an irritation in the skin. Animal food, or anything greasy with the slightest portion of salt in it, such as butter, will produce an intense itching, and induce the bird to pluck its feathers. Give it a good bathing with tepid water every other day, using a watering-pot with a fine rose, and place the cage before the fire—not too near—for the bird to dry itself; hang a cloth over the cage to prevent its taking cold. Give it barley seed, bread soaked in water, and a couple of small cods daily; also some Scotch apple, potato-buffed, and a crust of bread, occasionally soaked in warm tea without any milk. Place in the cage a large pan of water for it to bathe in, also a stick of wood, which will amuse the bird.

MANAGEMENT OF STINGS.—In answer to "A.B.'s" inquiry, in page 594, my experience teaches me that when a hive of bees has filled all its available space, and there is honey abroad, they will at once enter any space, and through any aperture that may be given to them. I have seen them come outside, and work comb under the board, and last year I was called to look at a hive standing in an open-fronted beehouse, which was working under a fold in an old sack thrown over the hive, and on its removal there were nearly a lbs. of fine honey deposited on the side of the skep. "A.B.'s" hives that swarmed had commenced raising queens before being supered. Bees will die out in warm weather when they have spare room inside. My opinion is that "A.B.'s" bees did not enter the supers, simply because their hives were not filled inside, and they therefore never needed them. The heat would make the hives look fuller than they were, and last year the bees had enough to do at times to provide for the daily consumption.

FISHES ON GOLD FISH. *W. H. H.*.—They will to a considerable extent clear off the fungus if a layer of sand is at the bottom of the water. We believe that if kept warmer there would be no fungus. It is certain that the fish change from a golden to a black colour because the water is too cold. If it is kept at a temperature of from 65° to 70°, the golden colour returns.

WEEKLY CALENDAR.

Day of Month	Day of Week	DECEMBER 24-30, 1868.	Average Temperature near London.			Rain in last 41 years.	Sun Rises.	Sun Sets.	Moon Rises.	Moon Sets.	Moon's Age.	Clock before Sun.	Day of Year
			Day.	Night.	Mean.	Days.	m.	h.	m.	h.	m.	h.	
24	Th		43.6	31.4	37.5	17	7	47	51	43	11	9	359
25	F	CHRISTMAS DAY.	43.3	29.2	35.3	9	7	8	57	37	1	33	360
26	S	Royal Horticultural Society, Promenade.	43.2	31.2	37.2	15	7	8	57	37	2	3	361
27	Scn	1 SUNDAY AFTER CHRISTMAS.	43.1	29.7	35.3	14	8	8	57	37	3	4	362
28	M	INNOCENTS.	42.5	29.5	34.5	12	8	8	57	37	4	5	363
29	Tu		43.5	31.5	37.5	19	8	8	57	37	5	6	364
30	W		44.7	32.9	38.3	15	8	8	57	37	6	7	365

From observations taken near London during the last forty-one years, the average day temperature of the week is 43.1°; and its night temperature 30.9°. The greatest heat was 55°, on the 25th, 1837; and 1-12. 1855; and the lowest cold 1° below zero, on the 25th, 1859. The greatest fall of rain was 0.62 inch.

CHRISTMAS.

Remember the chorons of an old Carol was somewhat, or altogether, thus—

"Hail, Father Christmas! hail to thee!
Honour'd ever shalt thou be!
All the sweets that love bestows.
Endless pleasures wait on those
Who, like vassals brave and true,
Give to Christmas homage due.

Now, we shall do our best to pay that homage to the utmost—we shall eat all the appropriate eatables and drink all the appropriate drinkables, and burn a Yule log on the very evening of the day that this is published, and we shall wish "A Merry Christmas" to every one, beginning at those nearest and dearest to us, down to those most remotely dear to us—namely, those who are intending to enrol themselves among our subscribers.

Now, among those subscribers, we are gladdened by knowing that we have many artisans and labourers, and among these, in a little cottage on a slope of the Mendip Hills, lives one who introduced himself by saying, "My cot is my own. I gave up beer and tobacco whilst very young, and my intended wife added to mine her savings until we could buy this cot; and now we are married, and we delight in beautifying our home." What a word of power is that! Why do not more such men exist among us—why do not more men have such wives and such homes? We will reply by publishing the following, written and sent to us by one who is now one of England's most-esteemed and well-to-do gardeners, and whose own right hand, and clear head, and kind heart have helped him up the ladder of life.

"Whilst the inmates of some working-men's homes are now rejoicing over their roast beef and plum pudding—thanks to their own prudent foresight, or the kindness of others—let us have a few minutes' converse on the rather unsatisfactory condition and the prospects of the labourer. And, first, we think this has been owing to a disrelish for general intelligence, a want of 'push,' and too great an attachment to mere locality. For these evils the Poor Laws and the law of settlement, with all their advantages, have something to answer. Young people were afraid to leave their parish. There was something like a horror in the thought of missing the ringing of the church bells, to which parents and grandparents had listened.

"The change in the law of settlement and a cheap press are already doing wonders. Young men will not loiter at home on parish allowance; and local booksellers tell that the great bulk of the serials circulating among the households of labourers are mostly of an informing and bettering character. Every energetic man who leaves the neighbourhood where labourers are too abundant, will make it better for those who remain behind. The worst of this manfully going away is that it is always the most intelligent and energetic that go; the lethargic and the indolent could never make a way for themselves, and they will act wisely by staying at home.

"Secondly, the unsatisfactory condition was often produced by a deficiency in self-respecting independence of

character. With all its advantages, the Poor Law did something to promote this deficiency. It was greatly added to by a custom that obtained of paying single men and married men differently. We have known a stout active young man, and a first-rate workman when he liked, receiving about two-thirds of the wages given to a poor weakly married man, because he had a wife and so many children. Was this any inducement to a young man to put forth his strength and energies? Did it not hold out an inducement to contract even an imprudent union, so that his wages might be raised in consequence? No better plan could be devised for souring everything like independence of feeling out of a man. Not long since we were told that of women employed in a hay field, the single women were paid one-fourth less than those who were married!

"Then some good-meaning people, who gave low wages, made a sort of compromise with their conscience by giving doles of charity at certain times. We have seen women and men trooping off to get these doles, sometimes a sixpence or a shilling, and wasting more time than would have enabled them to earn what was given to them. No plan could be more effectual to smother all self-respect.

"A great change has taken place for the better. Many just go on as before—run to the relieving officer and the parish doctor whenever there is the least trouble with themselves or their families. There is a vast difference in parishes and unions in this respect, and when people are receiving fair wages, there is a propriety in not letting them have what they want in this case too easily when they are a few days off work. But a great many of our best labourers will not resort to any such help, except at the last extremity, and when thoroughly forced to do it. They have doctors' clubs on various plans, but supported entirely by themselves. Generally each member pays so much a-year. Then, in connection with such clubs, or independent of them, there are friendly relieving societies, from which, in cases of illness, members draw out so much a week, in proportion to what they pay in, taking care, however, that the sum shall be below rather than above the usual weekly wages of the member.

"Notwithstanding post-office savings banks and annuities, these societies will long be favourites with the humbler working classes, and help to constitute the sinew and backbone of an honourable self-respect. Gentlemen and all employers of labour will find it to be their interest to encourage them: for nothing is so effectual for keeping down poor rates in a district. No better thoughtful kindness could be exhibited than giving a present to the funds, and advising the members to have their rules and regulations referred to and approved by Mr. Tidd Pratt. Labouring men who would not be interfered with by another workman, or by employers of labour not so much above them, would be proud of the counsel and advice of the squire or gentlemen in the neighbourhood.

"Another cause of this unsatisfactory condition is to be found in the want of prudent forethought. Let a man only sink into apathetic indifference, and believe he can scarcely be worse off, and a great effort will be required to

make him think prudently of the future. He becomes a hand-to-mouth man, luxuriates when wages are good and employment ample, and exists as best he can when circumstances are otherwise. The presence or the absence of this prudence just makes all the difference very often between a happy and a cheerless home, between substantial furniture and a rickety four-footed stool, between going to church and chapel clothed in broadcloth, and going there or nowhere with a shabby fustian coat or smockfrock, concealing what is worse beneath it. Examples of such contrasts may too often be seen among those who work at similar labour, receive the same wages, have similar homesteads, and are situated very much the same as respects their families. In the one case there is making the most of everything, thinking of the future, and much self-denial as to the present. In the other the present is everything—thrifless improvidence rules, and then in the hour of misery the blame is laid on everybody and on everything except the right quarter.

"Dressing respectably on Sunday is almost as good a test of self-respecting industry, as seeing nice healthy plants in a cottage window is an evidence that you will find thrift and comfort inside. Some of our sisters in humble life may go to an extreme in flaunting, flashy, worthless finery, in imitation of the substantial finery of those high in station. In this we might take a lesson from the women in the French provinces, who dress as their grandmothers did, and never attempt in this respect to imitate the aristocracy any more than they would attempt to imitate them in the furnishing of their houses. On this subject we would press lightly, believing that the beautiful has its mission, and that after all flaunting, tawdry finery is better than flying rags. Prudence, however, would say, That where means are not abundant, the substantial rather than the mere show should be fixed upon.

"Thoughtlessness generally enlarks in early improvident marriage. Strange, but not the less true, the most improvident, the most poor—those who themselves have been dragged through poverty into a miserable existence, rather than reared and nourished, are the first to marry—the first to entail the same wretched dragging-up, if possible, system upon their offspring. Does it come from the yearning of the human heart to have something living that it can call its own—the feeling that prompts the old woman who lives but scantily in a cellar or garret in London to keep her cat or kitten, and stint herself of the daily halfpenny to the catsmeat man? Even in the depths of poverty there is a pleasure in having something we can call our own. Early marriages are the most natural, and always to be commended when contracted with prudence. We have no faith in the reality, and the strength, and the continuance of a love that never thinks of what will be the position as to comfort of the loved object. Many of these marriages though so early, are yet too late to meet the requirements even of social morality. When a boy and girl thus marry—for they can scarcely be considered otherwise when not out of their 'teens'—and tenant a small place of their own, they may get on by mutually resolving to succeed by self-denial, even if they have little to furnish their house with, except themselves. But woe betide such a young couple when, from mistaken kindness, they are taken in, and continued as residents in the home of either of their parents. There is a great temptation to perpetuate past imprudence in continuous improvidence, and bitterly do they feel it when, with greatly augmented responsibilities, they are ultimately turned out, to commence an unprepared for housekeeping on their own account. Great, also, is the outcry when there is anything like a general clearing out—gentlemen, landlords, farmers, every one is blamed; except those who have brought such misery on themselves by improvidence and self-indulgence. Were we to be swayed by some newspaper writers we should come to the conclusion that the great duty of a gentleman landlord is to build cottages on his estate as fast as the people on that estate increased and multiplied. Nothing is to be considered as to the landlord's ability or willingness, nothing as to the questionable propriety of collecting great numbers of people in one neighbourhood, whilst the remunerative labour could well be performed by the half of such a population.

"We have met with several instances in which landlords have erected model cottages in model villages, with every necessary adjunct for comfort and decency for moderate-sized families, and given the possession on the terms that such cottages were to be inhabited solely by themselves; and yet, quietly and gradually, first one couple, and, perhaps, another would be admitted, until there were two or three families, or parts of families, in the rooms intended for one; and when

fever and other ailments visited such overcrowding, and doctors threatened and remonstrated, dire was the outcry when there was something like a general clearing out—we say general, because in many cases, rather than the interloping younger branches should turn out alone, the old father and mother would turn out with them. It would have been truer kindness to have had more frequent inspections, and to have insisted on the primary conditions of tenure. It is pleasant for parents to have their children about them, but in this country it is rare that the highest in rank can indulge this natural feeling. The humblest may well imitate their example, and scatter and settle where work is most plentiful and most remunerative. The crowding in cottages is not only injurious to the healthy action of body and mind, but from the great competition ever lowers the wages of labour, and renders these wages uncertain. We may mourn over all such ills, and cannot but admire the charity which in such circumstances gives its help; but chiefly, and above all, do we reverence and love that prudent kindness, which, without overlooking present needs, chiefly aims at helping the labourer to become his own best and most efficient helper.

"Lastly, the unsatisfactory condition of the labourer is somewhat owing to the want of a due stimulus to exertion in the hope of attaining a better and more comfortable social position in the same kind of employment. We have alluded to the comforts a farm labourer may possess when he takes into his council prudence and self-denial; but in the same calling or occupation he can hardly expect such a rise in social position as was open to his grandfather, or even father. The happy plough boy that, whistling cheerily, 'drove his team a-field,' could live on in the hope of having a little farm and team of his own. We can recollect scores, if not hundreds, of little farms, some with their pair of horses, some with one horse, and some with no horse at all, but hiring to plough the bit of land; but the tenants had a lot of cows and pigs, and they kept a rough but plentiful home, such as many a plough boy saw in his dreams, would be occupied by him and his loved one when they had saved enough between them. With few exceptions all such hopes now would be vain. It is saddening to visit the old places, and to be unable to find a trace of the foundations of the homesteads, in which in our early days we had feasted on new milk and curds and whey. It is neither our intention nor our province to enter upon the consideration of doing away with small farms, and uniting them into larger ones, but no doubt can remain as to its effect in damping exertion and prudent economy on the part of youthful agricultural labourers. It should never be forgotten that, however faithfully and conscientiously a man may labour for another, it would not be fair to expect that he would labour as thoroughly for wages as he would do for himself, thus receiving all the benefits and proceeds of his labour. Even the hope of this will nerve to toil, whilst the dissipating of the hope will tend to depress and enervate.

"If there is but little chance of a farm however small, there is less chance of purchasing as much land as would supply labour and support a family. From causes which we need not linger over, such as the difficulties about conveyancing and titles, the fact that land is property that cannot run or melt away; that its possession gives a certain social position, and furnishes the means for sport and recreation, it can rarely be obtained, and especially in small quantities, at less than double its natural value. Some pieces of land were lately sold, situated two or three miles from a small market town, and with nothing particular to recommend them in any way, and yet brought fully upon an average £100 per acre, whilst the annual rental of the land surrounding it was from 20s. to 30s. per acre. The possession of a bit of land is, therefore, but seldom to be hoped for by a labourer however prudent, and thus another stimulus to persevering exertion is removed.

"What then remains?—not depression; not despondency; not the ever grumbling of the idle; not the complaining and bawling for help of the self-indulgent and slothful; not the crying for others to do what you ought to do for yourself. No! these will do little for you; but the contented enjoyment of those blessings which even now industry, and prudence, and self-denial will give; or the studying and preparing yourselves to act as general managers of farms, or land stewards to gentlemen; or the taking your energy and acquired intelligence to bear on the rich virgin soils of our colonies and the western hemisphere, where, for clever agriculturists more especially, there is almost a world of fields and meadows for the taking and the keeping. Whilst rejoicing in every act of kindness and

of sympathy, we more especially rejoice in what tends to enable the struggling to raise themselves, and although in following this up, there may be heart pangs in leaving the homes of our childhood and youth, we should never forget that

“ True happiness has no localities :
No tones provincial : no peculiar garb ;
Where duty went, she went, with justice went,
And went with meekness, charity, and love,
Where'er a tear was dried, a wounded heart
Bound up, a bruised spirit with the dew
Of sympathy anointed.”

“ Wherever, let us add, there is a field for honest industry, a sphere for developing rectitude of character, trust in Providence, and kind sympathy for our fellows, there will happiness be found.”

SPRING FLOWERS.

I WENT this year to see the spring flower garden at Belvoir, and would strongly advise those who can, to pay Belvoir a visit next March, or, perhaps, in the end of February, if the season be an early one. I never shall forget the impression it made upon me. No summer garden, however gay, could compare favourably with the quiet beauty of that fairy scene. It was gay enough to satisfy any lover of colour, yet it was not gaudy like some summer gardens, where masses of bright colours, unrelieved and untuned, dazzle and fatigue the eye.

Belvoir has great natural advantages for a spring garden. With a warm oolitic soil many feet above the fogs of the valley, the gardens sloping to the south, and screened in every direction except the south by beautiful woods, it enjoys a climate unmatched, perhaps, in the midland counties, still it would be difficult to find a worse managed place than Belvoir was before Mr. Ingram took charge of it. What are natural advantages without the skill to turn them to account? After a very careful survey of every part, I came to the conclusion that exquisite taste in arrangement had more to do with the effect than any natural advantages. A situation where *Rhododendrons* *Nobleanum*, *dauricum*, and the hybrids of *dauricum* and *ciliatum*, &c., will every year escape spring frosts is not often seen; but the greater part of the plants employed may be grown in any garden. I was so charmed with the general effect, that it was some time before I could descend into particulars, and really it was surprising that common plants were chiefly employed—Common *Primroses*, *Aubrietias*, *Arabis caucasica*, *Doronicum caucasicum*, *Violets*, *Myosotis intermedia*, *Arabis variegata*, blue *Pansies*, *Daisies* white and red; the chief effect was produced by these very common flowers. A few *Tulips*, *Hyacinths*, double *Primroses*, and *Rhododendrons* heightened the effect. Then there were beds of foliage only, filled with dwarf-growing *Saxifrages* and plants of that description, which reminded me of Indian shawls, the quiet tertiary colours were so beautifully contrasted and blended. The whole left the impression on my mind that few refined ladies had the exquisite taste possessed by Mr. Ingram.

I find most persons who saw Belvoir last season think this style of gardening can only be carried out by a duke. I believe this is a great mistake. The summer garden—*i.e.*, the planting of *Pelargoniums* and other tender plants in large numbers has spread till now every suburban villa is so decorated, and in a little time few will be satisfied to have their beds bare from October till June. It is not a very serious thing to plant a lot of flowers ready prepared in November, and remove them to a clean piece of ground in the kitchen garden in May. It will be found to involve a greater amount of labour to keep them clean without removal. Herbaceous plants standing long in one place are very troublesome to keep alive or free from weeds, and with few exceptions are better of a change of soil. People in general appear to follow one of two ideas with herbaceous plants, either to let them stand in one place till they are too large for the situation, or die, as the case may be; or else to remove them every year and cut them into small pieces each time. There appears no necessity to leave a plant in one place till the soil is exhausted, or to reduce its size when not too large. Free-growing plants removed twice a-year may be always kept compact, yet large enough to produce the required effect, and may also be planted thickly without injury. A little forethought, a few beds in the kitchen garden, a few trenches, as if prepared for Celery, in which to grow *Primroses*, and a few day labourers, and all the beds last year filled with beautiful flowers, now lying bare and desolate, might be filled with plants, and next spring gay with flowers. Let anyone try the effect of planting the centre of a round bed with

Arabis caucasica and surrounding it with a broad belt of *Aubrietia*, or planting a few red *Tulips* in a bed covered with *Arabis*, and then see what they will say may be done with spring flowers. I say covered, because spring flowers ought to cover the ground when in bloom to produce all the effect of which they are capable.—J. R. PEARSON, *Chilwell*.

THE CLAIMS OF WINTER ORNAMENTAL GARDENING.

IN again inviting the attention of your readers to this branch of gardening, I must necessarily repeat much that I have urged in former years, with such additions, however, as practice has enabled me to advance with some degree of assurance. Winter ornamental gardening has become popular in many places, and the desire of discovering means to make it more attractive is constantly urging on those who seek to make further advances. It is to be hoped, therefore, that the progress already made will lead to still further improvement, and that plants adapted for winter gardening will be as eagerly sought after as those grown for a display in spring and the early part of summer.

Of late years much has been said and written about spring gardening, and nurserymen and seedsmen vie with each other in supplying plants or seeds of plants likely to make a good display at that time, still in many places something more was wanted. Spring flowers are, after all, but what their name implies—that is, they flower in spring, the only difference being, that in mild winters they come in a little earlier than they do after severe weather, but it is spring before they produce any display of consequence, or, say, from the middle of March till a later period, and many of the plants recommended as spring flowers are not in their full beauty till the end of May. Few, but very few, naturally present us with their flowers out of doors before the end of February, such being *Snowdrops*, *Winter Aconites*, and *Christmas Roses*, with, perchance, in mild winters, a few *Primroses*; but these delay their appearance until later if the season is unfavourable. I also presume that it will be acknowledged by all, that December and January are entirely destitute of floral beauties, excepting when a very mild autumn bequeaths a few *Chrysanthemums* still respectable at the beginning of December, and the other plants above mentioned may follow. It is vain, however, to look for anything like a floral display in open flower beds—say, from the middle of November till the middle of March, four months, or one-third of the year. In some large places the good appearance of the flower beds at this particular time is of more consequence than the spring display, as it is common for families of high rank, who spend the winter at their country houses, to depart for London early in March, or perhaps before; and in most cases where spring display is the order of the day, the appearance of the beds previous to that month is tame indeed. If bulbs are planted, *Crocuses* are rarely in flower until March, excepting in favoured situations, or mild winters, consequently the beds present but a sorry aspect in the dead of winter, and the bare soil is almost all there is to look at, or if there are plants above the surface, they are so small, and in appearance so unimportant, as not to attract attention.

Now, another reason for recommending a winter display, instead of waiting for one in spring, is the interference of the latter with the summer planting, for assuming that in most places the ulterior intention is to have a good display in summer as well as in spring, such a result is only attained at the expense of a greatly increased amount of trouble, and at a later period of the season, for it rarely happens that the spring flowers can be planted before the beginning, or, perhaps, middle of June. Much of the season is then gone, and although it is possible to have the summer crop of plants advancing in larger pots than usual, this extra care of so many plants at a time where watering is a daily and important affair, and other work plentiful enough, tends to make spring gardening, however pretty-sounding it may be, rather costly. Now, what I advocate does not interfere with the preparation and planting, at their proper time, of the summer occupants of the flower beds, nor in any way impair the efficiency of the beds for supporting the summer crop, which cannot be said of the spring-flowering plants. I may here remark, that to plant spring-flowering plants sparingly over the beds in the autumn, and put in the summer crop amongst them in May, as I have done more than twenty years ago, is seldom satisfactory, both crops being likely to prove failures: so that where a good appearance is expected

say from the beginning of July till March, or the period between the close and commencement of the London season, the summer, autumn, and winter display is certainly of more consequence than that for the spring. There are many such cases, and I make no apology for recommending in these the winter instead of the spring decoration of the flower garden.

Taking, therefore, this view of the question—that is, making as good a show as possible from the earliest period that bedding plants of ordinary kinds can be had in bloom, until the middle or end of March, in an unbroken line or nearly so, we shall find, as is almost always the case, that some frosty morning in November, or earlier in the autumn, destroys what remains of beauty may still be left to the *Pelargonium*, *Verbenas*, *Calceolarias*, and similar plants, occupying the most conspicuous positions. Very often the beds in which these are principally planted are in front of the mansion, where it is advisable at all times to present a respectable, if not gay appearance, and it is the blank which always follows the flower beds being stripped of their summer furniture that has led in so many instances to the adoption of permanent polychrome beds or compartments. It is very likely that Mr. Nesfield, to whom we owe so many good examples of this art, was led to adopt it as a remedy or partial remedy for the evil just referred to; but whether so or not, certain it is that in midwinter these tasteful arrangements of colouring, with a certain blending of foliage, receive their full share of attention at this time. The question, then, may very properly be asked, Cannot such an arrangement be prepared on a less elaborate scale, perhaps, for winter use only? whilst allowing certain flowers to luxuriate in plain mother earth during the proper period of the year, and contribute their share towards effecting a display at the fitting time. In many cases, as will hereafter be shown, this can be done, and with a less amount of trouble than is bestowed on the propagation of plants for spring ornament, while the system proposed has also the advantage, and that a by-no-means unimportant one, of affording a change every year, and thereby giving scope to the endless variety of forms and arrangements which the materials employed are capable of assuming. The interest thus created is by no means the least important part of the affair, besides which, the plants that suggest themselves to our use multiply each season, and give greater variety, and enable us to weed out inferior ones.

In the arrangement of the winter decoration of the flower beds here, due regard is paid to the requirements of the ensuing summer's crop as well as to the display for the time being; and as a good depth of well-prepared soil is necessary to render our flower beds capable of supporting their occupants without artificial watering in such seasons as the past, we have for many years been in the habit of trenching all our flower beds upwards of 2 feet deep, sometimes 2½ feet or more, in all cases burying the plants in the bottom of the trench. Accordingly, whenever the frost or wet weather destroys all that remains of beauty in such plants as *Pelargoniums* and *Calceolarias*, these, if not wanted elsewhere, are trenched in as described; and even in the beds intended for winter decoration this is done, as the vegetation is buried too deeply to interfere with the planting of anything that may be required. It is well to hasten on this operation, so as to have the whole completed and the winter plants put in before rain falls, which in November is not likely to be long in coming, and it is much better alike for the operator and the well-being of the plants that they should be planted while the ground is not too wet. Although the ground is at all times injured in texture by being trampled on when wet, this is of less consequence in autumn than in spring, from the greater length of time there is for the frosts of winter and melting winds of spring to restore the soil to its proper condition, yet there can be no doubt but the less it is trampled upon when it is wet and in the loose, light condition it is after trenching, the better it is for all purposes. For these reasons I have always made it a point to carry on such work, after it has been once begun, as fast as circumstances allow. As one of the largest beds we have to operate upon consists of between 10 or 11 poles or perches of ground, it will be seen that but a small portion of it can be reached from the outside, while small beds of 3 or 6 feet across can often be trenched at times when one of such size could not be touched. In our case dry weather is important, and immediately after the trenching has been finished, and any unevenness of the surface rectified by levelling, the ground is regularly and firmly trodden all over, so as to prevent as far as possible its sinking unevenly while undergoing the process of planting, or covering with coloured materials, as will be described.

The bed being now a smoothed or flattened surface of earth, and a plan more or less elaborate selected, the various figures are marked out. Generally, for convenience, I begin with a central one, and the beds being large, usually a modification of some geometrical design is adopted, a coloured scroll or embroidery work being combined with groups, or compartments of plants selected for their good appearance in midwinter. It will easily be perceived that variety of form may be given to a space of this kind; in fact, I never copy any portion of previous years' arrangements, nor need it be done.

For the guidance of those who may be disposed to engage in this sort of ornamentation I may give the same advice I have often given to those making flower beds on lawns, which is, that the simplest forms are the best. No figure whatever, in my opinion, looks so well as a plain circle when planted, and next to it is an oval. The reason is obvious enough; the eye, except when close to the object, can rarely take in the whole of the outline of fancy figures, owing to the growth of the plants concealing the margin farthest from the spectator, whereas in a circle, the portion behind being a counterpart of that immediately in view, the whole is understood if it be not actually seen, which it is more likely to be in a circle than in any other figure. But however much weight these considerations ought to have as regards groups that are planted, there is no objection to any amount of fancy work that may be thought desirable in conjunction with the groups, as it is expected that the embroidery, if I may so call it, will be distinctly seen from any point of view, and by introducing it judiciously the general appearance of the whole is much enhanced, but avoid too much crowding in the portion where the groups of plants are.—J. ROSSON.

(To be continued.)

WALL-FRUIT TREE PROTECTION.

The late gales have made sad havoc with my "serim." They have torn it to shreds. I have now put up a stouter material, No. 2 sail-cloth, about 22 inches wide. To the sail-cloth brass rings are affixed which run on two iron rods as for bed curtains. The rods are five-eighths of an inch in diameter, and 10 feet in length. The upright battens, on which the lower rods rest in staples, are 10 feet apart. They are 3½ inches wide each way. One foot in length tarred is let into the ground, and the upper part of the battens is painted white. These battens may in summer be either removed, or stay in their position. The upper rings run on a rod of similar length and strength to the rod which rests on the battens, having in the centre an open rest with lips to support the weight of the iron, which here, with the violence of the wind, would otherwise draw the staples at the ends. In situations protected from the violent assaults of the south-west wind lighter materials would do. The rings are attached to the curtains with tar twine four or five times doubled and twisted, and sewn to the sheets and rings with strong twine. I doubt whether even that will be sufficient to withstand such gales as we have had here lately.

My object in putting the curtains up so early is to keep off snow, which, when it thaws and is suddenly followed, before the trees are dry, by zero temperature, gives a greater power to frost to injure the bark of these natives of Persia. Frost following rain or melted snow, before the tree is dry, is one cause of canker. No one can in England count upon a crop of Peaches, Nectarines, or Apricots without some kind of spring covering to keep the night dews and rains out of the blossoms after expansion.

Napoleon I. said, "Impossible was not French," and I say that though it is difficult and laborious to produce large crops of the above fruits annually, yet it can be done. No one can have a more exposed place than this, and yet I expect, in the face of great difficulties, to show next season that, "impossible is not English."

I have upwards of 120 Peach and Nectarine trees, pruned on the alternate system, in fine condition, and promising a fine result. I have given in a previous article a list of the varieties of both, but I have since added two more trees of the Princess of Wales, a splendid late Peach, two Lord Palmerston, one Lady Palmerston, and two Mr. Kadclyffe, all late Peaches, and successional to the Princess of Wales. They are Mr. Rivers's seedlings, and are said to be first-rate. These will carry me into October. Later than this such fruits out of doors would rarely be good in England. Five out of the above

seedlings are maiden trees, but I expect to obtain a little fruit off each next season. I have not cut them down, which is the usual plan, but headed the trees down to 1 foot, and tied-in the side shoots with bast, which I use in the place of shreds, which are unsightly and harbour all kinds of vermin. You must not tie the bast too tightly, or you will produce gum.—W. P. RADCLIFFE.

POINSETTIA PULCHERRIMA POISONOUS.

As a warning to hothouse gardeners, I think it my duty to inform you of an accident which occurred to Mr. Buck, my gardener. On the 8th of this month, as he was pruning a plant of *Poinsettia pulcherrima*, he cut his thumb, but took no notice of it at the time, so slight was the incision. On the Thursday following, however, he felt an unpleasant pricking sensation in the thumb, which soon extended up the arm. On Friday it was succeeded by great numbness in his right arm and leg, and upon consulting a medical man he found that the poisonous juice of the plant produced these painful sensations. His leg was so much benumbed as to render it useless, but upon further applications of the fomentations and other remedies prescribed, the baneful effects have now subsided, leaving only a few spots on the lower part of his thumb, similar to those of the small-pox. I considered that the above statement was sufficiently important to be noticed in your valuable publication, *THE JOURNAL OF HORTICULTURE*.—OSWALD MOSLEY, Bart., *Rollleston Hall*.

PLANTING MINIATURE FRUIT TREES.

Will "C. C. E.," who kindly gave us a short account of his unfortunate experience of bush-tree culture, tell us if he attributes the unfruitfulness of his trees solely to biennial removal, or is the soil in fault, or are the trees themselves too young to produce much fruit?

Now, as I am about to purchase a few trees and plant a small plot of ground, I must confess that I read the remarks made by "C. C. E." with not a little discomfiture, and almost abandoned the idea of going to the expense of planting any myself. Will "C. C. E.," if he has any trees planted in the first year of his practice, and only lifted them once, tell me how they succeed? or will any of my brother readers of the *Journal*, who have already planted miniature fruit gardens, give me a little of their experience, and tell me what twelve kinds of Plums, the same complement of Cherries, and half that number of Pears, succeed best as miniature trees, and possess the two following qualities:—1st, That of being the most prolific and abundant bearers; 2nd, That of forming the most ornamental and handsome pyramids. Also what six Apples—viz., the three very largest either for dessert or kitchen purposes; one medium-sized red-skinned variety; one small yellow-skinned variety; and one small russet variety—have proved themselves to be the most prolific, grown either as bushes or pyramids?

I think the experience which "C. C. E." reported, and the information I now ask, may be of some service and act as a guide to those who have already planted, and to those who are about to plant, a miniature fruit garden.—X. N. X.

[In brief answer to the foregoing questions, I can in no way blame my soil, which is all that I can desire. The trees are quite large enough to bear—say from ten to twenty-five Pears or Apples, and from twenty to one hundred Plums; their unfruitfulness I attribute entirely to the "lifting," followed, as that operation was, by an unusually dry and hot summer. They are now full of fruit-spurs, have short-jointed wood, and look, as a whole, as well and promising as possible, and next year I hope to be able, if desired, to chronicle a result more encouraging to those who are interested in the same delightful branch of horticulture.

I have no trees planted in the first year of my practice, and only lifted once, which I can adduce as fair samples for the guidance of Treble X; for the first that I planted were established trees, and of such Rivers's Early Prolific and Victoria Plums have answered my utmost expectations, having produced abundant crops, being a perfect mass of purple three autumns out of the five.

I dare not presume to tell what twelve kinds of Plums, &c., to plant in a locality and soil of which I know nothing, but I should try almost anywhere Victoria, Rivers's Early Prolific, Prince Englebert, Diamond, Mrs. Gisborne, Pond's Seedling,

and Mitchelson's or Dancer's No. 1, though the last-named has proved here a weakly grower, and much subject to aphids. I ought, perhaps, to add to the above list Reine Claude de Bavière and Chapman's Prince of Wales. Bigarreau Cleveland has done better than any other Cherry with me; then Eiton and Florence. Beurré Diel, Beurré de Capiaumont, Beurré Clairgèan, and Beurré d'Amanlis Panaché Pears assume a pyramidal form readily and bear well. Louise Bonne of Jersey, Comte de Lamy, Winter Nelis, and Williams's Bon Chrétien are of far better quality, but not quite so easily trained, yet should not be omitted, and from all I hear Doyenné du Commerce should find a place in every garden.

Warner's King has produced the largest Apples that I have grown. Beauty of Kent is also very fine. Nelson's Glory (not Lord Nelson), said to be a very large Apple, being on the Crab stock has not yet fruited. But these huge Apples, I fancy, are a mistake; and Lord Suffield (the best of all), Domino (early), Small's Admirable, Court-Pendu-Plat, and Frogmore Pippin I find as good as any for dwarf culture. For a "red-skinned" Apple take Devonshire Quarrenden; for a yellow, perhaps Keddleston Pippin is as good as any. But surely Treble X will not omit Cox's Orange, a grand Apple, which forms a beautiful compact bush full of fruit-spurs, and though I have not reaped much as yet from some forty trees I am confident that the harvest is to come.

Though Treble X may know far more about the habits of fruit trees than I do, yet I am sure he will pardon me for warning him not to suffer a single fruit to ripen during the first year after planting. I have tried the experiment, not because I disbelieved, but for the sake of proving the advice given to myself, and in every instance the tree has been ruined. Even in the second year unless the tree be very vigorous, pull off all the fruit and let the sap go to make the foundation of a tree that will repay you manyfold, for your self-denial, in future years.—C. C. E.]

RINGING TO PROMOTE ROOT-EMISSION.

Will Mr. Charles Roberts oblige me with particulars of the operation of "ringing the bottom to facilitate the emission of roots" in growing "shrubs as standards," and also state how wide are the rings to be, how deep, and how near to the roots?—C. C. E.

[In reply to the above inquiries respecting the operation of ringing the suckers of Lilacs and other shrubs to facilitate the emission of roots, I cannot state the exact measurement of the rings I made, as none was taken, but as nearly as I can judge the strongest of the suckers would have measured 1½ inch in circumference, and the width of the ring depended on the strength of the suckers; for the strongest 1 inch wide, and for weaker suckers three-quarters of an inch wide, cut out to the depth of the bark. If this is not thoroughly cut out to its whole depth the wound heals, and the emission of roots is but little promoted. If the suckers to be operated upon are root suckers, the bottom cut of the ring is to be 2 inches from the top part of the roots, covering the cut to the depth of 8 inches with sandy soil. If the suckers are from the stool of an old plant cut down, and there are no roots to the bottom of the sucker, the bottom of the ring may then be 1 inch from the stool from which the sucker has issued.—C. ROBERTS, *Dorfold Hall*.]

POMOLOGICAL GLEANINGS.

SEVERAL cases of the fruiting of that exceedingly pretty and interesting plant, the *POMEGRANATE*, have come under our notice during the season. The fruiting has principally, however, been the result of chance; and these handsome fruits are not nearly so much cultivated or so common as they deserve to be. The cultivation is exceedingly simple. It will be remembered that a few years ago Mr. Downing, gardener to T. Grissell, Esq., Norbury Park, Dorking, exhibited at South Kensington some magnificent examples of Pomegranates which were the admiration of everybody. They were, indeed, equal to any of the imported specimens. These had been grown in a cool orchard house. Every season since, this plant has produced quantities of fruit which have been frequently exhibited. Those exhibited by Mr. Downing at a late meeting of the Fruit Committee were not quite so fine as usual, although still handsome. They were accompanied by the following letter from the exhibitor explaining his method of culture:—"The plant had been in my orchard house for some years in a wide border,

and only on one or two occasions had it put out a single blossom. Suspecting that the want of success in obtaining fruit arose from too luxuriant a growth, I had the roots cut away to within about 2 feet of the stem, and I then enclosed the roots with brickwork. After one intervening season the tree blossomed, and bore fruit abundantly. I employ no heat, as it would be inconvenient for me to do so where the tree is now planted; but I think if a little warmth could be conveniently given when the fruit is setting, and for a little while afterwards to promote growth, the fruit would be finer—indeed, quite equal to the growth of Italy or of any other congenial climate." We think so too, and can but recommend Mr. Downing's practice for adoption.

PEARS IN DEVON.

We have received some unusually large specimens of Pears grown by Mr. John Garland, gardener to Sir T. Dyke Arland, Bart., at Killerton, near Exeter. The largest is an Easter Beurré, measuring 13½ inches in circumference the long way over the stalk and eye (but, of course, not including the stalk), and 13 inches round the girth, and weighing 20½ ozs. It had begun to pass and had lost three-quarters of an ounce, Mr. Garland having weighed it 21 ozs. Glou Morceau is 12½ inches in its long circumference, and 11½ in girth, weighing 16½ ozs. Beurré de Rance is 13 inches in its long circumference, and 10½ in girth, weight 13 ozs. Winter Nelis is 10 inches in its long circumference, and 9½ in girth, weight 8 ozs. These are large specimens, and, unfortunately, in the case of the Easter Beurré and Glou Morceau decay at the core had begun, so that their true flavour could not be judged of. Beurré de Rance is not yet ripe; but Winter Nelis was in the highest degree in fine condition as regards texture of flesh and richness of flavour. We have received from Mr. Garland the following communication relating to these:—

"Winter Nelis and Beurré de Rance I planted ten years since, side by side on a wall having a southern aspect. Both are on the Quince stock. Easter Beurré and Glou Morceau I planted side by side on a wall with a western aspect. Both are on the Pear stock.

"The soil is a heavy loam of good quality, it being the top spit of an old pasture, such as is generally known as first-rate Melon soil by gardeners. No manure has been used except to mulch the trees the first year after planting. The garden is perfectly drained by Nature, being situated at the base and to the south of a bill of volcanic origin, the top of which, generally known in this neighbourhood as Killerton Clump, was planted by the present Mr. Veitch's grandfather. The hill is composed of solid rock, which is within 12 or 18 inches of the surface.

"The branches of each tree are trained horizontally from a central stem, three courses of bricks being the distance between the branches. Two years after planting I obtained four and five branches on each side in a season, by notching the central stem close above the bud I wished to break; cutting deepest, or half through, above the lowest buds, the next notch above being less deep, and the next proportionately less. The two top buds were not notched above, as they were certain to break freely. By the above method the growth of the branches was very evenly regulated. At the end of the fourth year after planting the branches had reached the top of the wall, or as near the top as they could be trained, there being fourteen on each side of the centre stem, and every two being exactly opposite each other, or along the same joint of brickwork.

"Every year since the above period, with the exception of Glou Morceau in 1866, the trees have all borne good crops of fruit. Winter Nelis bears so freely that I am obliged to thin the fruit every year to encourage growth at the points of the branches. This season the crop has been very heavy and is also very fine. I consider it the best Pear of its season, it being so richly flavoured, and so free a bearer. You saw the fruit of it and Doyenné du Comice which I exhibited at South Kensington, on the 17th of November.

"The tree of Doyenné du Comice I planted at the same time as the others—viz., ten years ago. It is growing as a pyramid in a border of the kitchen garden; its height is 16 feet, it is 10 feet through, and 6 inches in diameter at the base of the stem, and is on the Quince stock. It grows freely, forms a handsome pyramid, but is a very moderate bearer. I gather four or five times as much fruit from the tree of Winter Nelis I mentioned, as I gather from Doyenné du Comice. The fruit of Winter Nelis has the advantage of lasting much longer in

season than that of Doyenné du Comice; the latter, however, is a first-rate Pear, generally ripe by the middle of November, and lasts a fortnight in season. The first fruit I exhibited of it was at the Devon and Exeter Horticultural Society's Show, on the 11th of November, 1864, in the class for any sort, and it obtained the second prize. Until then it was quite unknown in this neighbourhood.

"The following are the weights of individual Pears grown here this season—viz.:

	ozs.		ozs.
Beurré Clairgeau	20½	Van Mons Léon le Clerc....	14½
Easter Beurré.....	21	Chamaoutel	14
Glou Morceau	15½	Beurré de Rance	13½
Doyenné du Comice	16½	Winter Nelis	8½

"The Easter Beurré is the same as I have sent, but it is not quite so heavy now.—JOHN GARLAND, *Killerton Gardens*.

"P.S.—At a monthly meeting of the members of the Devon and Exeter Horticultural Society and their gardeners, J. Somer, Esq., exhibited six Pears of Uvedale's St. Germain, weighing 14½ lbs. The same gentleman told me he had twenty-four of the same sort which weighed 48 lbs. He resides in this parish, Broadclyst."

VISITS TO GARDENS PUBLIC AND PRIVATE.

MESSRS. ROLLISSON & SONS', TOOTING.

THERE is not to my mind so pleasantly situated a nursery in the neighbourhood of the metropolis as this old-established and well-known one. The region of Tooting, Balham, &c., was quite unknown to me until a few months ago, when I paid my first visit to the Messrs. Rollisson's; and having lately had an opportunity of again seeing the establishment in its winter trim I am confirmed in my opinion. Its extent is about sixty acres of freehold land, running far back from the high road, with water, meadow land, and everything that can conduce to the well-doing of a nursery; while the well-known ability, and scientific and practical knowledge of the intelligent manager, Mr. Buckley, have secured for the firm that consideration to which it is so justly entitled; and it is very refreshing, in these days of hard-headedness, to observe the kindly feeling existing between proprietor and manager which is to be found here. It makes one sometimes question whether the "good old times" were a fable after all; and one feels pleased in the universal rush and go-a-headedness of these days, that there is room left for those kindlier feelings which ought ever to be found, and which tend so much to lighten the weight of what to all must be a burden in some form or other.

The portion of the nursery which fronts the main Tooting Road has a very noble and imposing appearance, as here are situated the large glass structures, and the ornamental ground, in the centre of which is placed a fountain. The entrance is through a noble conservatory of 130 feet long by 25 feet wide. Along the roof of this are trained fine plants of *Cobæa scandens variegata*, which is continually in flower; *Mandevilla suaveolens*; *Passiflora Impératrice Eugénie*, blue, rose, and white, the largest of all the Passion-flowers; *Lapageria rosea*, &c. Fine plants of some of the tree Ferns, as *Cyathea Smithii*, *Dicksonias*, &c., large plants of *Araucaria Cunninghamii* (the Moreton Bay Pine), *Camellias*, and other ornamental plants, filled up the centre of the house; while its borders were all edged with *Lycopodium*, giving it a fresh and green appearance, and at various times *Chrysanthemums* and other flowering plants are brought in to brighten it up. Next to this is a large Heath house, 100 feet long and 18 feet wide, containing a large stock of the different varieties of this very beautiful tribe—one which has indeed fallen into sad disfavour in these days, simply because it is one of the crucial tests of a gardener's skill. If a man can grow Heaths well he can do anything in the plant way. A very different matter indeed it is from filling a house with "bedding stuff," or growing Grapes, and yet how well deserving of care they are. Here were young healthy plants of different sizes, also what are called half-specimen plants, and a beautiful stock of such kinds as *Elegans*, *Cavendishii*, which was raised here many years ago, *Hartnelli*, *Massoni*, &c.

The stove contained a fine selection of flowering and ornamental-leaved plants; amongst the latter an excellent selection of Palms, a tribe which is coming more into favour with us now, and which will ultimately, I doubt not, be still more so. It is one to which additions are being constantly made. For instance, I saw at Brussels a fortnight ago M. Linden's collection, in which there are fifty new Palms! Amongst those most noticeable at Tooting were *Geonoma fenestralis*, with leaves curiously pieced; *Areca nobilis*, *concinna* (quite smooth),

rubra, aurea, and Intescens; *Verschaffeltia splendida*, *Calamus adspersus*, *Phonocophorum sechellarum*, and *Chamerops staurocartha*. There were, besides, young healthy plants of most of the ornamental-foliaged stove plants, such as *Alocasias*, *Crotons*, *Cyanophyllums*, &c.

In the house devoted to tree Ferns are some remarkably fine specimens, such as *Alsophila australis*, 9 feet high; *Cyathea dealbata*, 10 feet high, with fronds 5 feet long; *C. medullaris*, 12 feet high, one of the finest known; *C. Smithii*, 9 feet high, a most beautiful plant; *Dicksonia antarctica*, 9 feet; fibrosa, 7 feet; squarrosa, 1½ feet; *Cibotium Schiedei*, very graceful; *Todea africana*, of this I saw some enormous plants at Verschaffelt's, at Ghent; *Todea superba*, a most lovely and elegant Fern, and when covered with moisture nothing can be more lovely in the Fern tribe than this beautiful plant. It requires peculiar treatment, and should never be exposed to the rays of the sun. *Todea pellucida*, or *hymenophylloides*, is another very nearly its equal, exceedingly beautiful, and more easily grown. Among other greenhouse Ferns I noticed *Pteris straminea attenuata*, a variety in which the pinnules are exceedingly narrow, with all their points turned upwards, which gives the whole plant a very crisp appearance. This is new, and is now sent out for the first time. Then there was *Pteris erecta dactylifera*, an elegant crested Fern raised here, a hybrid from *P. erecta*. The fronds are 2 feet in length, and each of the pinnae from 6 to 9 inches long, and each point bears a pendant tassel of light green. This is quite new, and is now being sent out for the first time; and as it will grow either in a stove or greenhouse, it will doubtless be a general favourite.

In the stove fernery I noticed some nice plants of a beautiful new Fern, *Gymnogramma Rollissonii*, a hybrid between *G. ochracea* and *G. ferruginea*. Its fronds are 3 feet in length, beautifully arched, and the points of the pinnae pendant. It is the most vigorous of all the *Gymnogrammas*, except *G. totta*, grows well in an intermediate house, and will make, doubtless, a fine Fern for exhibition. There were also some good specimens of climbing Ferns, such as *Lomariopsis heteromorpha*, *Lygodium*, *Oleandra articulata*, and others. In fact, in all the departments of Ferns, stove, greenhouse, and hardy, there is an admirable selection; and I may draw attention to the recently published catalogue of Ferns, which has been brought out under the superintendence of Mr. Buckley, as being one of the most complete and exact catalogues that I have seen.

In the house devoted to hardwooded greenhouse plants, called also a Camellia house, there were some plants which well deserve attention, and ought to be grown by those who possess a greenhouse. Among them was *Rhododendron fragrantissimum*, a plant of surpassing excellence, with flowers of large size and most delicious perfume, one of them quite scenting a house. Then there were the old plant *Gnaphalium (Astelma) eximium*, with its woolly leaves and blood-red everlasting flowers; *Aerophyllum venosum* and *Dracophyllum gracile*, both excellent exhibition plants, and very showy in a greenhouse; *Epaeris multiflora*, crimson with white tips; *Adenandra fragrans*, an old but good greenhouse plant with pink flowers; and *Coronaria* of various sorts, another of those plants which so try the skill and patience of a plantsman, so subject are they to red spider. Here, too, was a fine lot of young *Azaleas* well set with flower buds.

In Orchids the Tooting nursery is very rich, and the house was full of fine plants in good condition, and to enumerate them would be simply to run through the list of the most favourite and rare of these lovely and curious plants. Some were in flower, but the season was a dead one for Orchids. *Calanthe Veitchii* was in bloom—a plant for which Mr. Buckley said Mr. Dominy ought to have had a gold medal, so successful an instance is it of hybridising, and so valuable for flowering in winter.

In the out-door department there is a most valuable collection of herbaceous plants of all kinds; amongst them a complete set of the now fashionable *Sempervivums*, and *Echeverias*, and *Saxifragas*; while the same completeness is manifested in all the various departments of a well-ordered nursery. I must not omit to mention that in the propagating house I saw a new *Tricolor Pelargonium*, which seemed to be a fine one, in the same style as *Lacy Grieve*, very high in colour, and of good habit. I may here mention that Messrs. Rollisson's *Tricolor Star of India* has proved with me one of the most attractive of the large number that we now possess. It is of the smooth-leaved section (*Sunset* style), and is a very good grower; while their *Tricolor Artemus Ward* is excellent for the edges of a bed, being of very neat habit.

I have given in this rapid sketch a few of the more salient points which struck me on my visit to this well-known nursery; and all who have had an opportunity of visiting it will agree, I think, with me, that I have not said a word too much in its favour.—D. Deal.

HEATING HOT WATER WITHOUT A BOILER.

On reading the very able and practical paper "Doings of the Last Week" (December 3rd, page 423), by Mr. R. Fish, I thought that possibly a cheap and efficient plan I have adopted of doing away with all kinds of boilers in the heating of hot-water pipes in glass houses, might be acceptable to many of the readers of your Journal.

Having been obliged by the cracking of the flues in one of my houses (caused by mining operations) to substitute pipes, and being in the midst of the manufacture of iron gas-tubing, I had a coil of 1½-inch pipe made and inserted in a brick furnace, as in the accompanying sketch. The fire is fed from the top, there being also two doors at the bottom of the furnace, one to clear the clinkers off the bars, and the other to close the ashpit. I have found it work and answer extremely well, heating 66 feet of 4-inch pipe, and it would heat double that amount if required.

It consists of five rings or coils of 1½-inch pipe, not coiled closely together, but about 1½ inch apart, 12 inches wide in the circle at the top, and widening downwards. This coil cost 30s. I have another coil of 2-inch pipe with seven rings. This heats 250 feet of 4-inch pipe, and cost £5. They give me the convenience of any quantity of hot water for the houses, from the wood cistern connected.

a, Chimney. b, Cistern. c, Damper.

The inside of the coil only is filled with fuel. The flames fill the furnace.

The fuel used is one-half clean cobbles of coal, at 5s. per ton, and the other half small washed gas coke or breeze, at 7s. per ton.—D. HAWKESFORD, *Bilston*.

[We have no doubt that your coil of pipes does all that you say, because we have known even simpler plans effectual. Used with care we have every reason to believe the coils would wear well, but they are more subject to accidents than a boiler, and we think a small cylinder boiler fed at the top, as you do your coil furnace, at a similar price, would act equally well, as £5 is a fair price for a boiler to heat 250 feet. The little cost of heating depends on the low price of the coal and coke, which would be more than double further south. We like the idea very much of taking the flow-pipe through the large wooden

cistern. We presume that your flow-pipe goes from the bottom of the cistern. In such a case, where much water is drawn off, the pipes are apt to be cooled, and hence, if we had the chance, we should like to have the cistern heated independently of the main circulation. The water would also be purer from not communicating directly with the boiler, but the plan you have adopted is well worthy of consideration.]

MILDNESS OF THE SEASON—CAMELLIA FLOWERING OUT OF DOORS.

It is not always that an autumn of unusual mildness follows a summer of more than ordinary heat, yet such seems to be the case this year; for although we had slight frosts earlier than usual, and these were followed by sharper ones in the beginning of November, it has been so much milder since that time, that were it not for the shortness of the days and the damp that prevails, we might be led to believe we were advancing far into April. Mild autumns and late winters, however, have occurred before, as I recollect one, about fourteen or fifteen years ago, in which Pelargoniums had stood through the dull dark days unprotected, and were fresh enough to furnish cuttings in the first week in February, but sharp frost set in at that time, and destroyed them and other plants. About twenty-four years ago, another mild autumn occurred, in which many country newspapers reported that Mushrooms were gathered in the fields up to the end of January; but these exceptional seasons are, perhaps, not the best for garden produce, as they encourage late and immature growth in some plants, although as regards others they may be beneficial. Amongst the latter, Roses have flowered out of doors in greater perfection than usual, and the variety of *Jasminum nudiflorum* against walls reminds one of spring. I have been a little surprised, however, at seeing one or two trusses of bloom fairly out on a Yellow Banksian Rose, growing against a pillar in a position not by any means well sheltered, and, perhaps, a more remarkable occurrence is the blooming of Camellias out of doors, several very good flowers having been gathered here from plants of the old Double White, that were planted out about four years ago in a fully exposed place. Some of the plants at the time being in bad health have recovered, and look robust and well.

Generally speaking, out-door Camellia blooms are injured and discoloured either by the cold or wet; but those above referred to, the first I have gathered out of doors before Christmas, are not in the least affected, and I would advise those who have favourable positions for this plant, to try it outside. I need hardly say that its growth is less rapid than when sheltered by glass, and growing in a well-prepared border; but the plants grow quite as rapidly as many that are kept in pots, and as evergreen shrubs vie with any other for appearance, when they are in good order. The interest, too, attached to them will always entitle them to much consideration, to which the chances of their now and then blooming will give them an additional claim. Perhaps those who have had plants out of doors for a number of years will state their experience in the matter.—J. ROXBOROUGH.

NOTES AND GLEANINGS.

We see it is announced that a Horticultural Congress is to be held at Manchester next July, that it will be under the auspices of the Royal Horticultural Society, and that Mr. T. Moore is to be the Secretary. We hope it may be well attended and prove satisfactory.

— Dr. M. T. MASTERS, Spring Grove, Isleworth, and Mr. H. J. Veitch, King's Road, Chelsea, have been appointed representatives of the Horticultural Society of Russia for making arrangements in this country relative to the INTERNATIONAL HORTICULTURAL EXHIBITION, to be held at St. Petersburg during May next. Any person requiring relative information must apply to either of the gentlemen named.

WORK FOR THE WEEK.

KITCHEN GARDEN.

See that *Cauliflowers* in all stages, *Endive*, *Lettuce*, stored roots, &c., are secured from frost. As soon as the weather will permit, make another sowing of any early sort of *Pea* and Early *Mazagan Beans* on the breasts of wide ridges, and lest the ground should be frozen hard afterwards, so as to impede their germination or cut them off when above the soil, have

plenty of long litter or spruce branches in readiness to scatter along the ridges. Keep up a regular supply of *Asparagus*, *Chicory*, *Sea-kale*, *Rhubarb*, &c. Where a family is constantly resident, it is in general bad policy to commence forcing earlier than the stock will enable one to meet the demand until a supply can be had from the open ground. Fresh beds of dung and leaves will require to be put in operation for *Radishes*, *Horn Carrots*, *Potatoes*, and early *Cucumbers*. Take care to make your beds large enough for the latter if you wish to avoid trouble and annoyance afterwards. The *Mushroom* beds out of doors will require to be carefully covered with litter and mats, &c. On those who are fond of the *Mushroom* (and in many families it is deemed as essential to good cookery as the Onion tribe), I would urge the importance of devoting to the purpose a house or back shed, to be heated by hot water. A good supply will thus be easily obtained, and much pleasure will be experienced in witnessing the growth of the *Mushrooms*. A bed completely covered with them is a beautiful sight at this season. With respect to the mode of cultivation, I do not think I can add much to what has been stated by Mr. Fish.

FRUIT GARDEN.

Prune and nail-in on five days everything except Peaches, Figs, Vines, and Raspberries; the nailing of these had better be deferred six weeks longer. Wheel dung, turn composts, and exercise judgment and forethought in regulating operations according to the state of the weather. Recollect if you wish to see your men energetic, able, and willing to push through labour in any emergency, you must study their health and comfort by providing suitable labour in unpropitious weather.

FLOWER GARDEN.

Where alterations and improvements are in contemplation, such as making new walks, making new flower beds, or re-lustating the soil of old ones where necessary, frosty weather, which we may expect after the heavy rains, rather accelerates than retards such operations. Holes for planting choice or new shrubs or trees may also be prepared by removing the bad soil and replacing it with a compost suitable to the plants; and even where trees are planted and not growing so well as could be desired, the soil may be carefully removed from the outer roots and replaced by proper soil. Should the weather send the men in-doors, plenty of work may be found for them in cutting pegs, making brooms, cleaning old flower sticks and making new ones, repairing rustic baskets, and painting wire trellises, garden chairs, water pots, &c.

GREENHOUSE AND CONSERVATORY.

Next to *Laelia gratissima*, *Gesnera zebrina* is the best conservatory plant we have in November and December; if the terminal spikes of flowers of this plant are cut off when they are three-parts down, and the plant returned to the stove for a short time, a host of lateral spikes will come up and last some time. A regular stove is far too hot for this plant when in flower, though stove culture assists it at other times; but to flower in summer a greenhouse treatment is necessary from the beginning, as already noticed.

HOUSE PLANTS IN GENERAL.

The surface soil in pots soon becomes exhausted by repeated watering, and repotting is not applicable in winter, therefore surfacing from time to time with a little fresh soil is all that can be done at present. After removing the soil on the surface of the pots, loosen the next layer down to the roots with a pointed stick, mixing a portion of fresh compost with it, and the next watering will carry the more sandy parts down among the roots, which will be of essential service to the plants. A porous surface, whether in a pot or in the field, is a point in cultivation which cannot be overrated. Little air need be given now to the conservatory as the forced flowers are brought in.

STOVE.

In reference to the shy-blooming kinds of Orchids, the most essential part of their management is to compel them to confine their growing season to our summers, say from the middle of May to the end of August. Stanhopeas are shy bloomers in the hands of some cultivators, but with others they flower regularly. Young plants of these are more difficult to flower than those which are established, because they are more liable to be influenced by changes of temperature or moisture. They will endure more hardships than any other of the tribe, and are therefore fit subjects for experiments. From the end of September to the beginning of May give no water at the roots, and from the end of November to the middle of February the proper temperature is 55°. The atmosphere should

not be drier than for a collection of stove plants, therefore the coldest end of a stove is a good place to winter them in. Early in March remove them to a warmer place—under the shade of an earlyinery, kept from 60° to 75°, or a Cucumber house will do; but constant shade is necessary, as the leaves are excited by the moisture of the atmosphere, while the material about the roots is so dry that atmospheric moisture can have no effect upon it. Some plants, however, will be apt to grow at this stage, particularly in the first season; these must be kept in a drier atmosphere, or in the driest end of the house. From 70° to 75° should be the temperature for April. Every bud now will be swollen, and the success of the plan depends in some measure on the length of time the buds can be kept in this state. As soon as they open into shoots plunge the roots in water till all the material about them is well soaked; after this, abundance of air, as much light as the leaves will endure, and a temperature of from 70° to 80° are essential till their growth is nearly finished. Under any mode of culture the young shoots must be preserved from too much moisture lodging in the centre, till they are ripe enough to endure it. The rationale of some of the points in this course is not so obvious as one could wish, but in every instance where the mode described has been tried the result has been favourable.

PITS AND FRAMES.

Plants in these structures, not artificially heated, will sustain no injury in frosty weather if they are left covered for weeks together, and, in truth, should they become frozen, it will be much better that they should remain covered, and be allowed to thaw gradually than be suddenly exposed to a heated atmosphere. In nature we see that plants sustain no injury under a covering of snow, even though it be a yard thick and continue for weeks, and why is this? not because, as some suppose, the snow is white, though that is very favourable to preventing the escape of terrestrial heat, but because the snow keeps the surface of the earth at an equal temperature, which is sufficient to prevent the plants from sustaining injury from the low temperature, and yet not sufficient to admit of their growth; therefore, if we can keep the plants from growing they will not sustain any injury by being for a time without light. Plants should present a dwarf and robust appearance, thus being well fitted to bear deprivation of light for some time if severe weather should set in. Damp has accumulated very much of late, owing to the heavy rains and cloudy weather with which we have been visited. It may be removed by giving air at the front and back in sunny days; but where the pits are heated by flues, a dry atmosphere may be obtained by putting on slight fires, at the same time allowing a free circulation of air amongst the plants.—W. KEANE.

DOINGS OF THE LAST WEEK.

A WEEK, on the whole, with on almost every night a downpouring, making us regret that we have been able to do but little towards storing some of the abundant supply of rain water that ran to waste. The wet has been a hindrance to out-door operations, otherwise the weather has had more of the mildness of the end of April, than of gloomy December.

KITCHEN GARDEN.

Everything is growing more tender than we like, and bundles of twigs of evergreens have been set aside in readiness to place among Lettuces, Cauliflowers, &c., if the weather should suddenly turn frosty, as many plants will be less able to stand it, than if the weather had been drier and colder. Bundles of dryish litter have also been put together in readiness to throw over beds of Celery, Culeworts, Violets, &c., if it should be judged necessary, as, after such free growth, two or three nights of severe frost would destroy almost everything. As yet we have not had a bad head of Celery this season. This is very fortunate, as we shall not have too much of it, and the latest planted did not grow very strong. One reason why we will protect some Violet beds from frost is, that though the flowers look well after frost, and seem but little injured, all the odour for which they are prized will be gone. We have seen nice little vases of the single Violet in winter, that, however they might please the eye, were no better, so far as scent was concerned, than so many leaves.

Near Radishes, on a sloping bank, is placed a heap of litter to protect them from frost when it comes, as they are as yet tender and crisp, and a little burnt rubbish strewn amongst them keeps many of their enemies at a distance. We have put

up our first hotbed for Radishes, and will sow them in rows alternately with Horn Carrots. We find it most economical to defer sowing Carrots until the turn of the days, and depend for young ones in winter on those sown late in summer. We will pot directly a lot of Ashleaf and Prolific Ashleaf Potatoes in small pots.

Cucumbers.—Put up also a rough hotbed for a frame, in which we will sow Cucumbers, as we generally find the young plants thrive better in dung heat, than in the heat from hot water, after January—that is, when they are young, and until they become strong plants for final planting out. Of late years, early in spring our plants, as respects bearing, ran a very close race, sometimes the frame beating the hot-water pit, and rather oftener the pit beating the frame, when plants of the same age were used for both. A double or a single light for seedlings thus sets pit-room at liberty, or leaves it to the winter Cucumbers, so that strong plants may be ready to put in before the winter-bearing ones are removed. Frequently, to prevent a want of Cucumbers, we grow a few plants to a large size in pots, and let these fruit in the hot-water pit in spring; and, planting out the others, those in pots come in more quickly, and when the planted-out Cucumbers come in, those in pots can also be renewed. We had good fruit last year from plants in 8-inch pots some weeks before we had any from those planted out, the plants being of the same age.

A word here as to sowing Cucumber seeds. "Beta" tells us, "I bought several new advertised sorts last season, and had not a healthy plant from them; on an average I had not more than one plant from six seeds, and none of the produce came up to the description. Surely the seeds must have been doctored, or deficient in some way." We do not readily believe in the doctoring of seeds by any respectable firm. One thing is perfectly evident, that any first gain made by such a practice is sure to be followed by great ultimate loss, as a man will rarely be deceived a second time. There are people who will have seeds at such a price, and stand out so much for quantity too, that we can feel little sympathy for them if they make a very dear instead of a cheap bargain. It is very rare that new Cucumber seed receives any "cooking" or preparing for market. A respectable seedsman would not allow two new seeds to be made up into a packet with four or half a dozen in which all vitality had been destroyed. In most cases, we believe the fault is more owing to the sower than to the seed merchant. We have given seed to others to sow, and have sown ourselves, and not obtained a single seedling, and from the same packet we have sown a second time and obtained a seedling from every seed. Too much wet, too much covering, will cause many a seed to rot, and too much dryness after the radicle of the seed has protruded, will cause it to shrivel up into a lifeless skeleton. Old Cucumber seeds, and new ones at all imperfectly ripened, are the most easily injured by moisture and deep covering. In either case the seeds will rot. The great point of safety is, in either case, to allow the seeds to absorb moisture very gradually, and still have the seeds within reach of the air.

We are presuming the heat is quite suitable, say averaging 70°. We have sown six-year-old Cucumber seeds in one pot, and not a plant did we raise; we have sown from the same packet, and had ten plants from twelve seeds. In the first case we sowed in fibrous soil, neither wet nor dry, covered to about the depth of one-eighth of an inch, watered, and placed the pot in the hotbed. In the second case the pot was filled with similar soil to within 1 inch of the rim, was then well watered, allowed to stand twenty-four hours to drain, then a sprinkling of drier soil was placed on the surface to the depth of nearly one-eighth of an inch, gently pressed down, and on that the seed was placed carefully, and then covered with about one-sixteenth of an inch of dryish soil, gently pressed, a square of glass laid over the pot after being set in the bed, so that air could pass under the glass, and a piece of paper over the glass to keep out sun light. In this case the moisture from the soil in the pot and from the bed was enough to enable the seed to absorb moisture slowly, so as gently to excite the germ of vitality instead of destroying it, and it was rare that any watering would be needed until the plumule or little stem began to show itself, and then only a little warm water was given at a time. Much the same care is required in the case of new seeds at all imperfectly ripened, as in their case the too free absorption of moisture, especially if they are too much covered up, so as to prevent the access of the oxygen of the air, will be apt to rot the germ.

A sort of excuse may be given for thus dwelling on these matters, as what applies to such a large seed as that of the

Cucumber will equally apply to the smallest seeds; but whilst care should be taken that such seeds should not be too moist at first, nor too much covered, greater care will be required in proportion to their smallness, that the seeds do not suffer from drought after they have swelled, and the radicle or root has protruded. With such attention to trifles there would be more success in raising seedlings, and seedsmen would not be blamed when thoroughly honest and far above all such practices as are too freely ascribed to them at times.

All this care in sowing, however, will not always ensure that the seedlings raised shall be true to the desired variety, and this uncertainty will generally be in proportion to the newness of the variety and the length to which it grows. All the older and shorter varieties seed pretty freely and have well-formed fruit, therefore it is easy to save good seed. The most of the long-growing kinds, fertilise how you may, produce seed sparingly. It is rare to obtain a seed from a fine specimen Cucumber of the long kinds, that, in addition to other desired properties, is as straight as and more uniform in girth than a gun barrel. An opportunity is taken to get seed from those with chubby ends and malformed fruit, because it can rarely be otherwise obtained. Need we wonder that thus the variety soon deteriorates? What would be thought of the stock-breeder who used the lame and the deformed of his flock to keep up the high character of his stock? and yet this, to a certain extent, must be done as respects these long fancy Cucumbers.

We recollect a particular case in point. Many years ago one of our best gardeners exhibited some fine, long, white-spined Cucumbers, with a splendid mealy bloom on them, and they were crisp and sweet, as well as pleasing to the eye. Seedsmen wished to have the seedling out of the variety. Towards the end of the summer something like chance gave us an opportunity to see six or eight lights of this Cucumber left for seed. There was not a single well-formed specimen, most were crooked and twisted, and looked as if they would yield abundance of seed. Need we wonder that in a couple of years or so the Cucumber got out of date? Some said they had been "sold," though there was not a doubt as to their having seed from the right stock. The raiser kept on with it, and did well with it; but then, no doubt, he was particular as to the fruit he had the seed from, and very likely if that did not please him he continued the variety by cuttings. "Beta" and other enthusiasts after long straight Cucumbers, will now see, that however honest the seedsman may be, there will always be a tendency to deterioration and sporting in these very long Cucumbers, and the grower will succeed best who saves his own seeds, and is content to save very few from well-formed fruit, instead of a great quantity from deformed ones. We have not seldom been forced to fall back on chubby, gouty-nosed fruit, because we could not get seed from a straight one, but though frequently the variety was thus continued tolerably pure, it was more than we had any right to expect. Facts when fairly stated will often remove very unpleasant misconceptions, whilst reticence and unwise attempts at concealment will only confirm them.

FRUIT GARDEN.

We must refer the reader to previous weeks' notices as to planting, transplanting, and pruning. Of the latter, and even under glass, we have not done so much as we wish owing to a press of out-door matters, but nothing has been allowed to be delayed too long.

Strawberries.—We have just made up a mild hotbed, chiefly of long litter and tree leaves. These were trodden rather firmly, and as even then the pots would be apt to sink more in the leaves than would be desirable, a depth of 2 or 3 inches of rotten dung was placed on the surface and firmly trodden, so that the pots should stand level without being plunged. The heat rising from the leaves will be enough to excite the plants gradually and gently. Beds formed at this season are apt in mild weather to heat too violently for the good of the roots of the Strawberries, as when to be moved to houses afterwards these do all these better when the roots have little more of what may be called bottom heat than the tops or buds. A strong heat also paralyses the roots, and when very warm burns them. We would prefer placing the plants in the bed on boards. This plan, with means to prevent overheating, brings the plants on gradually and gives them an advantage over those set in cool houses at once, as to the time of blooming and ripening. A few sashes at liberty thus give us the advantage of starting a house in which Strawberries are to be placed a month later. In a regular Strawberry house, which we would much prefer

to making, as we generally do, the Strawberry merely a super-numerary in other houses, and where fuel is no serious matter, we would prefer setting the pots on the shelves at once. There is always a risk at this season in plunging the plants in a bed, unless the heat be the very mildest. If the roots strike through into rich material there is ever a tendency in dull weather to the production of huge leaves, instead of bold strong flower trusses. Hence, though a little heat will help them on more than a cold pit or frame, we prefer that the roots clustering round and in every part of the pot should not be subjected directly to the action of the heat.

Cut mildewed berries out of the Grapes remaining. This weather, even with the advantage of fire heat and air during the day, has been rather unfavourable to their keeping well. Apples and Pears also want constant looking over.

ORNAMENTAL DEPARTMENT.

When not over wet rolled the lawn. Fresh-laid turf was too wet to be rolled, we had to be content with slightly heating. Where the ground was all levelled we could lay the turf down by using planks and boards for the men to stand on, and as they were light they were easily moved. Towards the end of the week we had to give up all attempts at levelling the ground, from the wetness. A correspondent tells us that he can do nothing with turf from half to three-quarters of an inch thick, and thinks we must be mistaken as to the thickness. We have laid loads between these two sizes, and when carting from a distance much cartage is saved. We have no fear of such thin turf now, and especially in such moist weather. Some of the first laid is growing beautifully. We should require similar turf to be double the thickness in March, and then there would often be the trouble of filling up the cracks, if not of watering. To make a fresh lawn, therefore, economically, the work is best done in the end of autumn and the beginning of winter. In large jobs it is very well to sow, but it takes some time before the finest seeds will equal good turf.

Tulips, especially of the best kinds, will require to be protected alike from heavy drenchings and severe frosts. Mats and a little long litter will be useful for these purposes. All bulbs and flowering roots must be protected from mice, by catching or otherwise doing away with the mice. We have known fine beds of Crocuses spoiled in a few nights. Besides poisoning and catching, we have sprinkled tar along the sides of the rows and patches with advantage, and the tar would be dried and innocent enough by the time the bulbs showed strongly above ground, and after that the mice more rarely touch them. When we place bulbs in a bed covered with ashes or leaf mould for the purpose of forcing, we have found no security against rats and mice so effectual as dropping a line of tar all round the bed, and sprinkling some over it.

Auriculas, Polyanthus, the finer Primroses, Carnations, Picotees, &c., kept in cold frames and pits should be frequently examined as to dryness and any appearance of damp. Whenever a few hours' sunshine occur the sashes should be taken off, but in this warm, foggy, dripping weather the sashes should be raised back and front to allow the air free passage, and so as to keep the plants robust and healthy.

Calceolarias.—Young plants from cuttings in the end of October, which we lately stated have rooted rather sooner than we wanted them, have been treated much in the same way as the above, only the sashes were pulled down in dry weather, even if dull and foggy, as a little damp, along with plenty of air, will rarely hurt such Calceolarias. We like as well when the cuttings do not root until about this time, as before they have made many roots they will stand rougher treatment. In severe weather we have had such Calceolarias covered up for a month or six weeks, after making sure that the temperature inside was cool enough to prevent growth and extension, and just above freezing-point; but when they are as thickly set as ours, about 1½ inch apart, and tolerably well rooted, they will not readily endure such long shutting up, if they should be called upon to meet it, but will require uncovering more frequently. Herbaceous Calceolarias of the large-flowering kinds, though equally rejoicing in a moist cool atmosphere, generally do better where in all seasons they can have light, and, therefore, will bloom all the sooner if light can be given, and the frost excluded by a little fire heat. It is easy to counteract the dryness from artificial heat. We have in years gone by grown great quantities of the herbaceous Calceolarias and Cinerarias, and felt often amused in reading the weekly direction to be sure not to spare tobacco smoke amongst them, as it was rarely we ever gave them a puff. A cool moist atmosphere will render all fumigation unnecessary. When removed

into a drier, warmer atmosphere the green fly will soon find them out.

Roses.—It is time that all fresh plantations were made, but we have some to plant, and cannot do so, as the ground is far too wet to enable us to do the work neatly, and planting when the ground is too wet is as bad as digging stiff soil in spring when it is too wet. After planting, it is best to defer pruning until the buds begin to swell, but if the shoots are long, a piece may be taken off the points, and the rather close pruning be left until the buds swell. Leaving the shoots thus longer helps the making of fresh roots earlier. Some of the hardier Roses, as the Damask, Provence, and the more robust Perpetuals, may be pruned, but all the more tender kinds should be left until the spring. Teas, and the tender Noisettes, &c., if not taken up should be protected with litter over the roots, and green twigs, fern, or straw, fastened lightly over the heads. If against walls, they will generally be safe enough with a few thin evergreen branches placed securely against them. They are well worth this little extra trouble, and if on their own roots, which is the best way, a little dry litter may be fastened over the surface of the ground. Placed Tea Roses, Perpetuals, and others in pots in a slight bottom heat, in a pit, along with *Deutzias*, *Weigelas*, &c., and put a lot taken from the open ground without any preparation into a slight hotbed out of doors.

This is a plan that can easily be adopted by anyone who can command a few barrowloads of tree leaves, or other fermenting material. Most of the plants we thus use would otherwise have been grubbed up, and we have often been as successful with them as with those grown in pots all the summer. In taking them up, we like to secure a good number of roots, caring little whether these roots are long or short. By twisting or otherwise, we put them into as small pots as they can be squeezed into, using rich sandy loam well firmed for the purpose. These plants, plunged into such a mild hotbed in the open air, and the pots just covered at first, and then covered a little deeper as the heat declines, will generally be tolerably well supplied with fresh roots in from a month to six weeks, whilst the buds on the shoots will scarcely be beginning to swell more than ordinarily. After the root feeders are thus secured, the pots may be moved to a forcing pit, a hothouse, or even a window or a greenhouse, but the slight hotbed would be best, with plenty of air at first. We have had the plants doing well in a greenhouse. Most shrubs, deciduous or evergreen, may be treated successfully in the same way. In fact, we treat them much as we would do a bulb, secure roots before we attempt to bring the flower stem much into excitement. Often when we could not procure bulbs when we wanted them, we have hurried them on after potting in a similar way, plunging the pots in a mild hotbed, and leaving the tops of the bulbs, exposed with only a few dry leaves over them in the case of frost. As soon as the roots nearly filled the pots, these pots were transferred to a hotbed or forcing pit, taking care to give plenty of air at first. Bulbs so treated we have had in fine bloom a month or six weeks earlier than it would have been safe to have forced those potted and placed in a cool, dark place in the usual way. Bear in mind, that with unprepared fresh-lifted shrubs, as well as with bulbs, you force successfully only when you have secured roots to meet the wants of the swelling flower buds and growing flower stems.—R. F.

TRADE CATALOGUE RECEIVED.

James Vetch & Sons, Royal Exotic Nursery, King's Road, Chelsea, S.W.—*Catalogue of Garden and Flower Seeds, Horticultural Implements, &c., for 1869.* With one Coloured Plate.

COVENT GARDEN MARKET.—DECEMBER 23.

GENERAL supplies abundant, with scarcely any variation in prices, the only active trade being in the various evergreens used for decoration. Of these there is no scarcity, as may well be supposed in the present open season.

TO CORRESPONDENTS.

*. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

N.B.—Many questions must remain unanswered until next week.

Books (*T. Trocke*).—Kean's "In-door Gardening," which you can have free by post from our office if you enclose twenty postage stamps with your address.

DIRECTION (*E. S. B.*).—The direction is 24, Bouverie Street, Fleet Street, London.

MELON APPLE (*Dupré*).—You are quite correct in stating that this is a most superior dessert Apple, but we were no less correct in stating that it is all that a culinary Apple should be. When in a boiled pudding its flesh becomes a complete pulp, with a flavour and perfume unsurpassed by those of any other Apple.

BANBARA VULGARIS VARIEGATA (*A Lady, Somersetshire*).—We have had so many applications for information where this can be obtained for winter garden decoration, that any nurseryman who has it would find it remunerative if he advertised it. We cannot trouble "AYRSHIRE GARDENER" on the subject.

MADRESFIELD COURT GRAPE (*North of Ireland Gardener*).—The description of this Grape in the "Florist and Pomologist," is quite correct. There is in that periodical a coloured portrait of a full-sized bunch.

ZONAL PELARGONIUMS FOR WINTER BLOOMING (*Rush*).—To flower well in winter the Pelargoniums you name require a temperature of from 45° to 50° at night and in dull days, and ought not to be in small pots, but should have been shifted into larger ones as soon as those they were in became full of roots, keeping them well stopped until August, so as to produce compact plants, and then allowing them to advance for bloom. As you wish the plants to flower in March, we would shift them now into pots a size larger, afford a light, airy position near the glass, keeping them gently growing, and by increasing the temperature to 45° or 50° about the middle of February, they will bloom in a month or six weeks. They should have an abundance of air, and be kept carefully watered; avoid making the soil too wet. For blooming at the time named the shoots must not now be stopped. The old plants are not good for winter blooming. They will not bloom well until April.

WATERING KALOSANTHES AND FUCHSIAS IN WINTER (*Idem*).—The Kalosanthos ought to be kept in a light, dry, and airy situation, and no water given except to prevent them from flagging. The Fuchsias, if young plants, should be similarly treated, the object being to keep them slowly growing. Old plants of Fuchsias may receive no water during the winter, providing the wood is not permitted to shrivel. They will do in any place secure from frost, if kept dry, and not unduly excited by heat without affording at the same time light and moisture.

PLANTING VINES (*E. S.*).—Your Vines, seven years old, which have been cut back and trained this season with one good strong shoot, will be suitable for planting out in the greenhouse. We have planted Vines when their shoots were 2 or 3 inches in length, but it has been from pots and young canes. In your case we would take up the Vines early in March if they are to be planted outside, carefully preserving all the roots possible, and at once plant, spreading out the roots, and covering with from 3 to 6 inches of rotten turf. If the Vines are to be planted inside, we would at once take them up and plant, keeping the house cool, and not watering them until March. They ought to be at once pruned to the length required.

QUICKLY-GROWING EVERGREEN (*R. S. S., Woodgate*).—In your soil we think *Berberis aquifolium* would answer your purpose.

HAY'S PATENT STOVE.—We cannot tell you where you can obtain fuel. It was patent charcoal we believe. There is now no agent for its sale, we believe.

TACONIA MOLLISSIMA NOT FLOWERING (*A. F.*).—We think if you were to keep your plant dry at the roots during the winter, or after it had made a good growth, and were to well harden it off by giving an abundance of air, it would flower well. Perhaps the roots have unlimited room, and on that account the growth is strong. Your only plan will be to allow the shoots a corresponding amount of room with the roots, or confine the latter within smaller limits, training the shoots not very closely together, but so as to be clear of each other, and not further from the glass than 9 inches—better 6 inches. Encourage the plant to make a good growth.

and well ripen it off, keeping the plant dry at the roots, but not so dry as to cause it to flag.

COCAO-NUT PALM SEED SOWING (W.).—The Cocoa-nut Palm may be raised from seed in a bottom heat of from 85° to 90°, and a corresponding top heat. February is a good time to put in the nuts.

POTATO ONION CULTURE (Constant Subscriber).—Underground or Potato Onions may be planted at the end of February or early in March, planting them so that they will be covered with soil, leaving the least possible portion of the neck of the bulb above the surface. A rich light soil is most suitable. They should be planted from 4 to 6 inches apart, in rows about 6 inches from each other. They require to be kept free from weeds, and should be taken up when the tops become yellow, tying them up in bunches in the same way as the other kind, and keeping them in a dry place. They are milder than the other kinds of Onions, but otherwise equal to them for use.

CULTURE OF TREE FERNS (W. H. H.).—The two that have made two fronds and died off may push others, providing the centre or hearts are not dead or destroyed, but that we could not say without seeing the plants. As the fronds have died off we should say the plants are dead. We would, however, leave them for some time longer—until July or August of next year, unless you ascertain there is no possibility of growth, keeping them well supplied with water, and the trunks or stems sprinkled with water twice a-day, but be careful not to allow the moisture to lodge in the hearts of the plants. The temperature is much too high; one of from 50° to 55° is ample at this season, encouraging growth in spring with a brisk heat and a moist rather close atmosphere.

EPHYPHYLLUM GRAFTING (M. L.).—You may graft a *Pereskia aculeata*, the thickness of a pencil, with the *Ephiphyllum truncatum*. Whip-grafting is the best method, though side-grafting will answer well, leaving a portion of the stock to which the graft can be secured after insertion. It should be done before the *Ephiphyllum* begins to grow. The graft should be secured with mat, and have a little moss placed over it and secured. It is well to have the stem of the stock and the graft of the same thickness at the point of union, and the outer edges on one side, at least, corresponding. If the plant be placed in a mild bottom heat, and be kept moist and shaded from bright sun, the graft will take more speedily.

WINTER CUCUMBER-GROWING (A. Young Gardener).—Your house or pit appears well arranged for winter Cucumber-growing, only we think there is not sufficient provision for bottom heat. The return pipe alone is not enough to heat a border one-half the width of the house, but you do not say what the width of the bed is, though from your stating it is in the centre of the pit, we conclude it is the full width. You have not too many pipes for top heat; it is an advantage to have a greater extent of surface heated than is absolutely necessary, as in this case greater facilities are afforded for air-giving, and the pipes do not require to be made so hot, and on that account the atmosphere is more congenial. You ought to have at least two 4-inch pipes for bottom heat, and they are best in a chamber covered with slabs of stone or slate, and 18 inches from the intended surface. The joints of the slabs should be left open, and on the slabs 6 inches thick of rubble should be placed, and over that a layer of sods, grass side downwards, and then the soil to the depth of 10 or 12 inches. The fruit swelling off with a knob at the end indicates a deficiency of bottom heat, which at this season ought to be 70°, and not higher than 75°, and the top heat should be from 60° to 65° at night, and from 70° to 75° by day, with a rise from sun heat. The evaporation troughs, we presume, are kept full of water, and in addition to that, the paths, if such exist, walls, &c., should be sprinkled with water about one o'clock daily in bright weather, and the house shut up. Your sorts are good for winter fruiting, and in general swell their fruit well. It would be desirable to make up a bed at one end and put in fresh plants, preserving a portion of the present plants until the others come into bearing. The pipe as it now is is of little value for bottom heat, and unless you have enough of that the growth of Cucumbers in winter is not satisfactory. The pit, as at present arranged, will do very well for Cucumber-growing in spring and summer, a good bed of fermenting materials being provided.

ARACARIA BROWN AT THE BOTTOM (Old Subscriber).—The cause of *Aracarias* becoming brown at the bottom is as yet unexplained, and we have no satisfactory reason to give, but we believe it is due to climate, that of England, except in favoured or sheltered situations, being too cold and wet. The majority of the plants 18 feet and upwards in height, which we have seen, are in much the same condition as yours. The dying-off of the branches of *Aracarias* is so very general, that we shall be obliged by information on the subject. We think it incurable, and have ceased to recommend the *Aracaria* being planted, except in sheltered situations, and where water does not stagnate in the subsoil. —G. A.

PRUNING VINES (Half Pay).—The Vines should be at once pruned. The side shoots should be cut back to two eyes, and the leading shoot or rod cut-in or cut back two-thirds of its length. Those cut back to two eyes are what are called spurs; you will find their treatment fully described in the "Vine Manual." The mildew was not caused by the Calceolarias taken up from the garden, but it may have resulted from insufficient ventilation. The remedy is to dust them with flowers of sulphur on its first appearance, and as often afterwards as it appears. Are you sure the Vines are mildewed? The Peach trees are more likely to have fostered the mildew, as you say it is upon them, therefore syringe them with a solution of Clarke's insect-destroying compound, 2 ozs. to the gallon, or paint every part of the trees with a solution at the rate of 3 ozs. to the gallon, using a paint brush. If mildew appear next season dust the parts immediately with flowers of sulphur. The Vine border should be covered with littery manure to the depth of about a foot, or with straw and leaves, but the manure is best. You will only need fires in the greenhouse to keep out frost, and not that if you have no plants in the house. The temperature from fire heat should not exceed 40°. The wood of the Peach trees being green and not half ripe, we would cut the shoots well in. This will give you good strong shoots another year, and you will be giving air freely secure their full maturation. How far are the Peach trees from the glass, and are they not too much shaded by the Vines? The Vines ought not to be nearer each other than 4 feet 6 inches, better 6 feet, to allow of sufficient light for the Peach trees. The best covers for a flue are fire tiles 3 inches thick; they are made of fire clark. We fear Peach trees will not succeed on an east wall. Early York Malta, and Mountaineer are among the hardiest. We should advise Plums, of which three good varieties are Kirke's, Jefferson, and Coe's

Golden Drop. Apricots would probably succeed; the best are Kaisha, Hemskenk, and Moorpark.

CUTTING OFF HERPATIC LEAVES (An Amateur).—The leaves should not be cut off. They will decay next summer. If removed it is probable the buds will not mature, and perhaps the plants would not flower, or if they did their flowering would be poor and of short continuance.

BRACKEN WITH DUNG FOR HOTBEDS (Idem).—The fronds of fern are not so good as leaves, but still useful for mixing with stable dung, as that moderates the heat and renders it more lasting.

PANSY CUTTINGS (Idem).—The cuttings put in under a north wall may receive slight protection during severe frost, removing it in mild weather.

REMOVING TRICOLOR PELARGONIUM FLOWERS (Idem).—We think the foliage is improved in size when the flowers are removed, but we do not consider the leaves are better coloured. The colouring is more or less intense according to the light.

FORMING PYRAMIDAL APPLE TREES (J. M. S.).—Your maiden trees, 4 feet high, should be cut back to a bud 12 inches from the ground. This proceeding will cause the production in spring of a number of shoots, which are all to be stopped when they have made six leaves each, except the shoot from the uppermost bud, which is to be trained upright and not stopped until it has grown 12 inches. When it has attained this length, before July take out its point, and it will most likely push laterals, one of which is to be trained as a leader, and the others stopped at the third leaf. All the shoots stopped at the sixth leaf, if they push after being stopped, are to have the shoot nearest the end of each pinched at the third joint, but the other laterals are to be stopped when they have made two leaves. The shoots should be disposed so as to form a symmetrical pyramid, widest at the base and gradually tapering upwards. The shoots, if inclined to grow erect and to cross each other, should be tied down and so regulated as not to be nearer than 6 inches, nor further apart than 5 inches. The leader, if it exceed 12 inches in length without side shoots, ought to be shortened to that length above the highest side shoots, and these should be cut back, if necessary, to give a symmetrical head. Any laterals on the side shoots not required for extension, should be cut back to within half an inch from whence they proceed. The subsequent treatment is similar to that in the previous year, and this must be persisted in until the trees are of the height required. The trees should now be mulched round the stems with 3 inches thick of littery manure, and in March they ought to have a top-dressing of rich compost or rotten manure to the depth of about an inch.

REPORTING ABUTILON (W. Cottrell).—The beginning of March is a good time to cut back the *Abutilon*, and report when it has pushed freely shoots 2 or 3 inches long. It succeeds in a compost of two-thirds turfy loam, and one-third leaf-mould, with a free admixture of silver sand. We cannot name plants from shoots; flowers as well as foliage are necessary.

PLANTS INFESTED WITH WHITE SCALE (Quack).—Your plants are more severely attacked by scale than any we have seen, judging from the specimens sent us. Syringe them with a solution of Clarke's insect-destroying compound, of the strength of 3 ozs. to the gallon, wetting every part thoroughly, and adding to every gallon of the solution six drops of spirits of turpentine. The plants should be syringed in two or three days afterwards with water at a temperature of 140°, and if the scale still remain repeat the syringing with the solution. The vapour of spirits of turpentine will not only kill the scale, but injure the plants, therefore avoid it. You may take up the *Tacsonia* and pot it, preserving as many roots as possible. If you deprive it of many roots the head should be reduced to a corresponding extent, and it would be desirable to do so, as the plant is so badly infested with scale.

PERETHEUM TUBERATUM (Old Subscriber).—We fear it would not succeed under a Plane tree. *Stachys lanata* would do so admirably, and so would *Vinca elegantissima*, which is very handsome. The small-leaved green and variegated *Ivy* would be suitable.

DWARF WHITE CELERY (Amateur).—We think the Incomparable would suit you. It is solid, crisp, and juicy, and of dwarf growth. If you wish for a larger kind, *Cole's Crystal* may suit you, it being early. The Champion Giant is a large and excellent white variety and early. There are no *Aeneas* proper that will bear the open air in the country. Of *Robinia pseud-Acacia*, *Bella Rosa*, *monophylla pyramidalis*, *sophorifolia*, *crispata*, *dubia*, *amorphifolia*, *inermis umbrellifera* (standard), *fasciculata*, and *D. caseinifera*, all of moderate growth, and *hispida* and its varieties, which are tall and spreading.

LINED OIL FOR DESTROYING MEALY BUG (P.).—The old bark being removed from Vines you may paint them with lined oil without injury, but we do not think it will penetrate into the crevices of the rods so as to destroy the mealy bug. Try Gishurst Compound or Clarke's preparation, both of which are advertised in this Journal.

TEREBENTHINE RADICANS CULTURE (Killarney).—The plant is probably kept too cool and not regularly moist. We would advise your placing it in a house where there is a temperature of from 40° to 45°; keep it well supplied with moisture, but not so much so at this season as in summer, taking the bell-glass off at least once a day and wiping it dry, and leave it a little tilted on one side, for this Fern likes a comparatively airy yet moist atmosphere.

FRUITING CANES OF VINES (Reader).—We presume that Vine growers mean by a fruiting cane, one strong enough to produce fruit, and that irrespective of its age. We have had rods less than a year from the bud more fit for fruiting than other plants of twice their age. In either case we consider it in general to be injudicious to take much of a crop from a fresh-planted Vine, but if the Vine is young and strong it will have in proportion more and stronger roots than a weaker though older plant. We find that *Trentham Black Grape* does well in a medium house, requiring rather more heat than a *Hamburg*, and less than a *Muscad*, though bearing well under the same circumstances as both. We shall be glad to have Mr. Stewart's further opinions and experience.

WOODEN FENCE FOR FRUIT TRAINING (W. F. Chapman).—A coping of wood would be the best under the circumstances, and removable when all danger of frost is over. The sloping of the coping upwards from the wall will not be so effectual as having the slope slightly the other way. We would advise woollen netting hung in front, in addition, when the trees open their bloom.

PACKING CASE (Idem).—We have examined the patented packing case, and think it a very good one, and a gamekeeper and a butcher think so too, but something of the same kind of case is frequently used, both in

the strong box and basket form, no cords or nails being used in either case, and the trays or inside boxes so arranged that no packing except paper is necessary. Nevertheless, your case seems a good one, and if cheap enough will, no doubt, sell with or without a patent.

AUCUBA BERRIES—DRAINING (H. D.).—They will become red next year. Place the draining-pipes beneath the lawn in your clayey soil 3 feet below the surface, and in lines 12 feet apart.

NAMES OF FRUIT (E. S.).—It is the Winter Strawberry Apple. (L. L. D.).—Your Apple is Lady's Finger. (T. Bunnard & Son).—Your seedling russet Apple is one of great excellence. (Peachen).—1, Easter Beurre;

2, Not known. (*Centurion*).—The Pear is Rondelet, not Winter Nellis; A, is not Chaumontel, and we cannot say what it is. The Apple is Reinette de Caux. (A. A.).—1, Crasanne; 2, Probably Winter Nellis; 3, Chaumontel; 5, Ravelstone Pippin.

NAMES OF PLANTS (H. G.).—We cannot name plants from their leaves only. (J. B. M.).—*Cestrum aurantiacum*. (H. D.).—1, Eupatorium, not determined, allied to *E. paniculatum*; 2, 5, 6, *Polystichum angulare*; 3, *Polystichum aculeatum*; 4, *Lastrea dilatata*. (*A. Inquirer*).—*Habrothamnus fasciculatus*. Requires ordinary greenhouse treatment. May be planted against a pillar with advantage.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending December 22nd.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

TRIMMING AND OTHER ARTIFICES AT SHOWS.

WHEN I wrote the other day, I stated that I did not then know the result of a formal protest I had handed in at Birmingham against a prize pen of Brahma hens, on the ground that the hocks of one of them were even more than usually trimmed. That result is shortly stated. I received the next day a note from the Secretary, stating that he had laid my protest "before the Council, and was directed to say the same could not be entertained." It was never even alleged that the accusation was false, and, had the case been defended on its merits, I had, and have, testimony which would place the matter beyond doubt.

At first I was naturally irate; but on looking over the Birmingham schedule I found that the Council could not do otherwise than they did, as they state that "no appeal can be had from the decision of the Judges unless some 'rule' of the Society be proved to be broken, and Birmingham has no rule whatever against trimming. Nay, on further examination, I find that Liverpool, Manchester, and Bristol are in the same position, so that I fear no committee which has not published a rule on the subject could withhold a prize without being subject to an action at law. Really, it is time the question were mooted! I state these facts that it may be seen I can sympathise with committees in their difficulties.

Nevertheless, what has appeared has had effect, for since then I have received copies of several schedules containing excellent "trimming clauses." Some of them have always contained them—others not. As a specimen I quote the Kendal schedule, which enacts that "Trimming, or artificial alteration of the plumage, or of any other part of a bird (except the comb of a Game fowl), will disqualify it from receiving a prize." The Whitehaven Society has a similar regulation.

And let not committees of shows which this year have no rule, think that they are absolved from responsibility. Their duty is—as "no appeal" can be made from the judges—to specially request their judges to give particular attention to this point, and to disqualify all evident cases. It is perfectly notorious that judges do not do this at present; if requested they may do so. They seem actually to be afraid of some exhibitors. We can all remember seeing occasionally some trickery exposed in these pages by them, with all the virtuous indignation imaginable, but in every case (I am speaking of poultry—I was glad to see prominent sinners disqualified in the Pigeon classes at Birmingham), the "example" has been some outsider, some exhibitor of no name or influence. I do not remember one case where an influential exhibitor has been exposed, though I have seen cases quite as bad and equally evident. Let committees, therefore, draw the attention of their arbitrators to this matter, and next year insert the needful clause in their schedules. The Birmingham Council, evidently, by the Pigeon decision, are anxious to do justice; and I have every confidence that next year such a protest as I made will not be made in vain. Meanwhile I am taking other steps,

the nature of which will soon be made public; and in the interim any who may be willing to give real aid in putting down this growing nuisance will greatly oblige if they will communicate with me through the Editors.

But now I want to mention an important phase of the matter. I learnt from personal friends that after I had left Birmingham a certain poultryman had been not only slandering me in many ways behind my back on account of my protest, but had openly decided my attempts to get justice done, saying that "nine-tenths of the exhibitors did it," and "was it likely we could put it down?" Now, let me earnestly impress upon all readers of our Journal that this is the real issue. Very frequently the trimming is not done by exhibitors themselves, who are often men of the highest honour. I believe this to have been the case with the very gentleman whose pen I objected to. But, on the one hand, there are comparatively few men paid to look after their master's stock and superintend his yards. Some of them it is a pleasure to know—others, like my kind critic above mentioned, have no ambition but to win, and will stoop to any meanness rather than be beaten. They are the real sinners, as they are the real masters, having sole control over the birds under their care. On the other hand there is the large class to which I and others belong, the real amateurs, who breed our own birds, who like to rear a few fine fowls at our own homes, and show them fairly in friendly competition, carrying into this useful hobby the manner and conduct of Christian gentlemen. We do not like to cheat, and so we are daily cheated. Yet we form by far the largest class of exhibitors; it is we who keep the poultry fancy from degenerating to the level of the prize-ring; and if ever the day come, as it seems fast coming, when no gentleman can win at a poultry show, the said fancy will never recover the deserved degradation.

Well, my critic and his clan laugh at us. And now the simple question is, Are we, the largest and most influential body, to be really at the mercy of a few fellows like this? It seems hard, rather; and I am not sure that we are so yet. We will have a hard fight for it first, and do our best. We want nothing but truth and justice; it may be we are strong enough to secure them in spite of the tricksters in the poultry world.

I may, perhaps, be allowed to say that I have not taken this matter up as a personal one. It is well known, on the one hand, that being engaged in business, and not able to afford the luxury of keeping one of the gentry I refer to, I very rarely show; and, on the other, that I am not quite a novice, and if I liked could "trim" hocks as neatly as — himself. No one could be less aggrieved personally than I am. I speak on behalf of the many who are not skilled in these deceptions, but only know how to show their fowls honestly as nature made them. All honour—notwithstanding my critic's ridicule—to their innocence! He thinks it very "green," but green is a handsomer colour than black after all.

One more sentence. At Birmingham I saw the first-prize Brahma cock of last year. Then he was trimmed, and got first prize; this time he was shown—all honour to his owner!—in his natural state, and was not named! In other respects he was in good order, and as well worth a prize as he was then, and he was equally locked last year—anyone could see it! What

a farce is judging, and what a lottery must be exhibiting, when success turns upon such things as these! Show a bird with culture hocks, he is disqualified. Pluck the hock, do it so clumsily that the greatest ignoramus in the world can see it, and you shall win the first prize! This is what judges and committees have brought us to, and this is what exhibitors have come to, in the year of grace 1863.—Nemo.

DECEPTIONS AT POULTRY SHOWS.

I was glad to observe from an advertisement in this Journal, that a meeting had been held at Birmingham for the purpose of adopting rules respecting the better arrangement of poultry exhibitions, which I hope will give honest men a better chance of obtaining prizes. I know perfectly well that many exhibitors borrow birds for the purpose of showing them. This should not be allowed, and every exhibitor ought to make a declaration that the birds are his property. Some judges make blind decisions. I myself exhibited a pen of French birds last year, and the judge told me that they were not worth above 1s. 6d. each. The same birds were shown at Preston, won the first prize, and were sold for £3. I think I stated in your Journal some time ago, that I would not exhibit my birds except where I could ascertain who were appointed judges.—J. G. MILNER, *Ballerby Vicarage*.

PROLIFIC HENS.

In "Our Letter Box" of November 26th, you say you once knew a hen which laid 240 eggs in one year, but she never laid again, and died soon afterwards. Now my old Braham laid 403 in two years, and up to to-day the number has reached 432. I weighed her myself this morning, and she was just 7½ lbs. She is in perfect health and plumage. I quite agree with you that people had much better count their eggs than guess at them.

Our arrangement for a fowl house is, that every fowl we possess has to come or go through a part of our dwelling-house to a small backyard to roost, where also boxes are placed for them to lay in, therefore there can be no mistake, as every hen is under the eye of the matron herself; but were we to guess, we would unhesitatingly give the palm to one of the old hen's progeny, but, unfortunately, her register was lost after she was twelve months old, but we are certain she beat her mother in her first year's laying by seven.

You say again in a back number that no food will make old fowls lay in winter. I have a correct account of all the eggs laid for the last three months of the year. On examining the book I find we had 204 in October, 141 in November, and seven yesterday (December 1st), from eleven old fowls, bred in 1866 and 1867, and two pullets of this year, one of which laid four eggs before she was five months old.

I think May is quite soon enough for hatching. I had some early birds last year, when, after laying their first batch of eggs, all moulted, which throws them back materially in winter. It would certainly be very interesting to have from keepers of various breeds of poultry accounts as to their adaptability for laying and other good points. Some poultry-keepers prefer one sort, others another, and so on. The Brahmas which we have are dark ones, with black or brown heads, I am told not fit for show birds, but what we want are laying capabilities.—J. P.

LEEDS POULTRY SHOW.

THIS year's meeting has been most successful; and we cannot but congratulate the Committee on the greatly improved arrangements. It is worthy of especial notice, that, though the number of shows occurring about the same date might have been expected to diminish the number of entries, and render the quality of the birds shown not so good, nothing of the kind has resulted; on the contrary, never was a Leeds Show so well supported on every hand. The Leeds Committee not only issued a very liberal prize schedule, but found the most ready response from exhibitors in general. An inspection of the prize list will prove that but very few indeed of the principal yards in the kingdom were unrepresented.

The *Game* fowls, as a rule, were remarkably good; the silver cup for the best pen of Game of any variety, being secured by an excellent pen of Brown Reds, birds of this season. Of *Dorkings* the Coloured varieties were very excellent, but in the Silver-Greys the bulk of the prizes were withheld. A first-rate pen of Dorkings, capable in all other respects of prize-taking almost at any exhibition, were "disqualified," from one of the hens being ruptured, no doubt the result of misapplied care and over-feeding. *Spanish* fowls were very well shown, and the *Cochin* classes were excellent, a pen of first-rate Partridge

chickens taking the *Cochin* cup. In *Brahmas*, the birds of 1863 were also successful in securing the silver cup, many of the adult birds being scarcely in full condition and feather. *Hamburghs*, as might be expected in this district, were of first-rate quality, the chickens of the Golden-spangled variety receiving the silver cup prize for the best pen of *Hamburghs* of any variety. The Black *Hamburghs* were especially worthy of favourable notice. The *Selling* class was very large, Black *Spanish* taking the first prize; White *Cochins* the second; and Dark *Brahmas* the third position. The *Game* breed of *Bantams* was the best variety of those popular "poultry pets," and the silver Bantam cup was awarded to it. As to the *Turkey*, *Geese*, and *Duck* classes, perhaps there was never anything nearly so good seen before in Leeds. The "Variety class" of Ducks was also especially good.

The class for dressed poultry was remarkable for its excellence. Mr. Dowsett, of Chelmsford, taking the prize for the best "dressed" chickens, with a pair of cockerels of this year, nearly 17 lbs. in weight. This gentleman seems now to have this class of premiums altogether in his own hands, and competitors seem to fear entering the lists against him. There were, however, at Leeds, some exceedingly good specimens shown by his opponents. We will here offer a hint worthy of attention—the *Turkeys* were not only dressed—that is, plucked, but also drawn, ready for cooking. This is a mistake, as any poultry if "drawn" five or six days before cooking, invariably loses its flavour, consequently all "dressed" poultry should be shown "plucked," but not drawn.

Another hint to the Leeds Committee, and if acted upon we fancy their arrangements will be very near perfection. It is, not to place the empty baskets on the tops of the pens; it obstructs the light, so necessary for the inspection of the birds, and at the same time it detracts from the appearance of the exhibition generally. The *Pigeons* constituted a very large portion of the Show, comparatively with the entries of former years.

We published the names of the Judges and their awards last week.

LIVERPOOL POULTRY SHOW.

IN all our experience of shows, we have never seen such a place as that selected for this. We have been in a Royal Riding School at Brighton; in the County Court at Derby; in Corn Exchanges everywhere. Tents have been pressed into the service. We have known the gipsy queen's caravan used as a Committee-room. We have never before seen a place where 358 pens of cattle, 1047 entries of poultry, and 570 entries of dogs could be accommodated under the same roof, with ample light and air, and the poultry enjoying the rare luxury of being shown in one even row—no upper, no lower tiers. The place covers two acres. The roof is very high, and it is sheltered from draughts, being open on one side only. Full space was allowed for everything exhibited, and there was room for a free circulation between the rows of pens. We do not speak of the decorations of the showyard, although the number of flags that found employment must have laid nautical providers under contribution to a large extent; the effect was good, and when the place was lighted with gas the appearance was very cheerful. The Committee, however, did not confine themselves to the decorative part alone. In the afternoon and evening immense tarpaulins formed emblems which were raised and lowered at pleasure, completely closing the only open side of the space used for the Show. An immense advantage is, that the greater part of the roof is glass; this admits the light to a most desirable extent at this season of the year. Our friends at Bingley Hall may copy this with advantage.

In the refreshment department Liverpool has gone far ahead of all competition. In elegance of decoration, in excellence of viands and liquids, and in the general management of the first-class rooms, it was unlike, because infinitely superior to anything we have ever before seen. Instead of crowding in front of a bar where nothing is to be had without a struggle, and all unsatisfactory in quality when obtained, the first class refreshment-rooms were approached through a wide and long corridor tastefully draped with alternate pink and white drapery. It was lighted by figures the size of life, five or six on each side, bearing gas lights. This led to a large room or hall decorated with equal taste, with the addition of mirrors and medallions, and containing numbers of long tables covered with clean cloths. In fact, it had the appearance of a first-rate and well-managed *café*.

The prize list gives such full details of the different classes, with their numerous commendations, that we must be content with such remarks as they may call forth, and that do not appear in the list of honours.

Mrs. Arkwright repeated her Birmingham victory, and took a reserved prize and cup with her adult *Dorking* cock. She was hard run by Admiral Hornby, who defeated her by taking the first prize in the class for birds of the year. These classes were excellent. The hens and pullets were worthy of their predecessors, and we have seldom seen two birds that pleased us more than those belonging to Dr. Campbell, which most deservedly took the cup. Thirteen pens only in these two classes were passed by the Judges. The Silver-Greys were not so numerous as their Coloured brethren, but they were very true indeed to colour. White *Dorkings* were large and good.

The first-prize *Cochin-China* cock was a grand bird, and we are not sure he is not the same bird that won at Birmingham. If he can be kept in the same form and condition he will be very hard to beat at

E. Tattersall, Newchurch. Highly Commended, G. R. Smith; W. Johnson, Stanley, Liverpool. *Pullets*.—First and Cup, C. W. Brierley. Second, J. Hodgson. Third, J. Fletcher. Highly Commended, Miss E. A. Crawford, Farnfield, Southwell, Notts; J. Wood; T. Mason. Commended, J. H. Wilson.

GAME (Duckwings, Greys and Blues).—*Cocks*.—First and Cup, Rev. F. Watson, Kelvedon. Second, Duke of Neweastle. Third, H. M. Julian. Commended, J. Barrow, jun., Bradley Field, Kendal. *Cockerels*.—First, J. Halsall, Ince, Wigan. Second, Rev. W. J. Mellor. Third, H. Jowett, Idle, Leeds. Highly Commended, T. Dyson, Halifax; W. Johnson, Hens. First G. W. Moss. Second, W. Johnson. Third, A. K. Briggs. Bradford. *Pullets*.—First, J. Holland. Second, G. S. Sainsbury. Devizes. Third, J. Halsall. Highly Commended, W. J. Cope, Barnsley.

GAME (White and Piles).—*Cocks*.—First, R. Butler, Cresswell, Chesterfield. Second, T. West, St. Ann's, Eccleston, St. Helens. Third, G. and C. Furness, Accrington. Highly Commended, E. H. Woodcock, Wigan. *Hens and Pullets*.—First and Cup, R. Butler. Second, J. Mason, Worcester. Third, J. Fletcher. Commended, G. W. Moss.

BANTAMS (Gold and Silver-legged).—First, H. Draycott, Hamberstone, Leicester. Second, Third, and Highly Commended, M. Leno.

BANTAMS (Black, clean-legged).—First, J. W. Morris, Rochdale. Second, W. A. Taylor.

BANTAMS (White, clean-legged).—First, H. Draycott. Second, W. A. Taylor.

BANTAMS (Any other variety except Game).—Prize, H. Saville (Japanese Silkies).

GAME BANTAMS (Black-breasted Red).—First, and Cup, J. W. Morris. Second, J. W. Kellaway, Merton, Isle of Wight. Third, J. Henshall, Salford. Highly Commended, H. Ashton; J. Halsall. Commended, J. Statter; Bowman & Fearon.

GAME BANTAMS (Brown and other Reds except Black-breasted).—First, Miss E. A. Crawford, Farnfield, Southwell. Second, J. Crossland, jun., Wakefield. Third, T. Sharples, Rawtenstall. Commended, G. & C. Furness. *GAME BANTAMS* (Any other variety).—First, J. Crossland, jun. Second, W. Parker, Clay Cross. Third, L. Biney. Highly Commended, H. Shumack, Southwell, Notts.

GAME BANTAM COCKS (Black-breasted and other Reds).—First and Cup, J. W. Morris. Second, J. K. Robinson. Third, J. J. Cousins. Highly Commended, W. & H. Buckley, Accrington; J. Halsall. Commended, L. Biney; W. & H. Buckley; J. Holme, Knowley.

GAME BANTAM COCKS (Any other variety).—First, J. Crossland, jun. Second, Miss E. A. Crawford. Third, H. Shumack.

ANY OTHER DISTINCT VARIETY.—First and Second, Col. Stuart Wortley, Grove End Road, London (French). Third, J. K. Fowler (French). Fourth, Hon. H. W. Fitzwilliam (La Fleche). Highly Commended, J. Bibby, jun., Liverpool (Creve-Coeurs); G. & C. Furness (Cuckoo Cochins); J. Sichel (Creve-Coeurs); T. Walsley (Buff Polish); Hon. H. W. Fitzwilliam (Adalians). Commended, Hon. H. W. Fitzwilliam (La Fleche).

DUCKS (Rouen).—First and Second, T. Statter, jun. Third, J. K. Fowler. Highly Commended, J. Maxwell, Aigburth; Gunson & Jefferson; R. W. Boyle. Commended, A. Woods.

DUCKS (Aylesbury).—First and Second, Mrs. H. Seamons. Third, J. K. Fowler. Highly Commended, J. S. Banner, Liverpool; J. K. Fowler; E. Leech.

DUCKS (Black East Indian).—First, Rev. W. Serjeantson. Second, J. Wood. Highly Commended, F. W. Earle; Rev. W. Serjeantson.

DUCKS (Any other variety).—First, R. W. Boyle (Carolinas). Second, C. N. Baker, Chelsea (Carolinas). Highly Commended, R. W. Doyle (Mandarin); J. Sharp, Liverpool (Brown Call); J. Wood (Mandarin and Wild); R. P. Williams (Bahama).

GEESSE (White).—First and Cup, E. Leech. Second, J. Bryers, Ormeskirk. *Goslings*.—First, T. Statter, jun. Second, S. H. Stott, Rochdale.

GEESSE (Grey and Mottled).—First, T. Statter, jun. Second, J. K. Fowler. Highly Commended, S. H. Stott. *Goslings*.—First, Rev. G. Hustler, Stillington, Vicarage, York. Second, J. Douglas. Highly Commended, J. K. Fowler; S. H. Stott.

TURKEYS.—*Cocks*.—First, J. N. Beasley. Second, T. Statter, jun. Highly Commended, E. Leech; J. Smith, Broder Hills, Grantham. *Cockerels*.—First, E. Leech. Second, J. Smith. Highly Commended, S. H. Stott; W. Sanday, Holme, Pierpoint; J. Wood. *Hens*.—First, J. Smith. Second, E. Leech. Highly Commended, J. Wood. *Poult*.—First, E. Leech. Second, J. Smith. Highly Commended, W. Sanday.

The Judges were J. Smith, Esq., Mr. Baily, Mr. Hewitt, Mr. Dixon, and Mr. Teebay.

GUILDFORD POULTRY SHOW.

This Show was held on the 14th and 15th inst., in conjunction with that of the Guildford Agricultural Association, and the following awards were made:—

DORKINGS.—First, M. Putney. Second, J. Clift. Third, P. Ross. Highly Commended, R. Pople; J. Clift; W. Franks; J. Attlee. Commended, J. C. Ramsden; Mrs. Norris.

SPANISH.—First, H. Brown. Second, Curtis & Ashby. Highly Commended, F. James.

COCHINS.—First, Curtis & Ashby. Second, Capt. Weston.

BRAMMAS.—First, J. Pares. Second, R. Wilson. Highly Commended, P. Crowley; G. Johnson; H. Brown. Commended, P. Crowley.

GAME.—First, A. C. Cross. Second, T. Sadler. Highly Commended, J. Pares.

HAMBURGS.—First, A. Moya. Second, J. Moon.

BANTAMS.—First, F. James. Second, H. Kisiag. Highly Commended, P. Crowley; J. Attlee; S. Smith.

DUCKS (Aylesbury).—First, E. Hilder. Second, Rev. Dr. Merriman. Highly Commended, L. A. Coussmaker; Rev. Dr. Merriman. Commended, E. F. Bennett.

DUCKS (Any other breed).—First, Mrs. Norris. Second, Hon. F. Scott. Highly Commended, E. Burge.

GEESSE.—First, W. Messenger. Second, J. Attlee. Highly Commended, E. Hilder.

TURKEYS.—First, W. Stevens. Second, Countess of Lovelace. Highly Commended, Miss Lushington; W. Messenger.

EXTRA PRIZES.—First, presented by J. Pares, Esq., Postford House, for the best pen of Any variety, not exhibited in either of the above classes,

Hon. F. Scott. Second, presented by J. Pares, Esq., R. Wilson. Highly Commended, J. Pares; H. S. Fraser. A Prize, the gift of Mr. F. R. Jackson, Guildford, for the best pen of White *Dorkings*.—P. Ross. A Prize the gift of — Matthews, Esq., for the best pen of Blue *Dorkings*.—W. Franks.

WEST OF ENGLAND POULTRY EXHIBITION.

This was held at Plymouth, on the 14th, 15th, and 16th instant. The following is a list of the prizes awarded:—

GAME (Black-breasted and other Reds).—First, T. & W. Clift, Plymouth. Second, H. Adey, Colthampton. Third, S. R. Harris, Cwennap.

GAME (Any other variety).—First, L. S. W. Grenfell, Tavistock. Second, N. Barber, Plymouth. Third, W. Curtis, St. Budeaux.

GAME (Any variety).—First, J. Harris, Liskard. Second, F. I. Keast, Callington.

MALAYS OR INDIAN GAME.—First and Second, H. Darch, Stratton. Highly Commended, J. Hinton, Bath. Commended, R. Hockaday.

DORKINGS (Any variety).—First, Rev. A. C. Thynne, Kilkhampton. Second and Third, L. Patton, Tanton.

COCHIN (Buff, Cinnamon, or White).—First, W. Hyman, Plymouth. Second, J. H. Nicholls, Lostwithiel. Third, L. Patton.

COCHIN (Partridge, or any variety).—First and Lady Lopes' Cup, J. Beard, St. Iazey. Second, J. Gardiner, Bristol. Third, E. Cornelius, Milton Abbot.

BRAMMAS (Light).—First, J. Dougal, Tavistock. Second, W. Q. Cole, Tones. Third, P. D. Maddox, Lameston.

BRAMMAS (Dark).—First, Rev. A. C. Thynne. Second and Third, J. H. Reid, Calstock.

POLANDS (Any variety).—First and Mrs. Kekewich's Cup, J. Hinton. Second, L. Patton.

SPANISH.—First, J. H. Reid. Second, Tonkin & Tuckey, Bristol. Third, J. H. Nicholls.

HAMBURGERS (Gold or Silver-pencilled).—First, S. R. Harris. Second, N. Barber. Third, J. H. Nicholls.

HAMBURGERS (Gold or Silver-spangled).—First, W. Hancock, St. Germain. Second, J. Woodley, Stratton. Third, T. Dyer, Redruth.

BANTAMS (Any variety).—First, N. Barber. Second, B. J. Dowhay, Calstock. Third, R. Maitle, Liskard.

ANY OTHER DISTINCT VARIETY.—First, F. Brewer, Lostwithiel. Second, J. Beard. Third, E. H. James, Plymouth.

SELLING CLASS.—First, S. Mitchell, Tavistock. Second, J. Dunstan, Penryn. Third, J. Collocott, Tavistock.

DUCKS (Any variety).—First, S. R. Harris. Second, J. Tell, Menheniot. Third, L. Patton.

GEESSE (Any variety).—First, L. Patton. Second, J. Dunstan.

TURKEYS (Any variety).—First, L. Patton. Second, Miss J. Milward, Bristol.

FREGONS.—*Carriers*.—First, P. Goss, Plymouth. Second, R. C. Bennett, Plymouth. *Tumblers*.—First, J. M. Erawn, Tavistock. Second, J. P. Bolt, Tavistock. *Fantails*.—First, Rev. W. S. Shaw, Bath. Second, Miss J. Milward. *Any other variety*.—First, Miss J. Milward. Second, Col. T. W. Hicks, Plymouth.

LOWESTOFT POULTRY SHOW.

This Show was held in the Town Hall, Lowestoft, a building well adapted for the purpose, on the 16th and 17th inst. The entries numbered upwards of 250, and in the Poultry department *Dorkings*, *Spanish*, *Hamburgers*, and *Game Bantams* were well represented.

Subjoined is a list of the awards:—

GAME (Any variety).—First, Cup, and Second, S. Matthews, Stowmarket (Brown Red). *Cockerels*.—First and Second, S. Matthews (Black Red and Duckwing). Commended, W. King, Lowestoft.

DORKINGS (Any variety).—First and Cup, J. Linwood, Barking, Needham Market. Second, J. Frost, Parham. Highly Commended, J. Frost; W. Keeble, Barnaby, Eeoles. *Cockerels*.—First, J. Frost. Second, Mrs. H. Sparrow, Sudbury. Very Highly Commended, W. King, Ipswich.

SPANISH.—Prize, W. P. Jellies, Ipswich. *Cockerels*.—First, Cup, and Highly Commended, W. B. Jellies. Second, H. Lingwood, Martlesham, Woodbridge.

COCHIN-CHINA (Any variety).—First, H. Lingwood, Martlesham. Second, H. Lingwood, Barking. Commended, W. P. Matthews. *Cockerels*.—First, H. Lingwood, Martlesham. Second, H. Lingwood, Barking. Highly Commended, Mrs. Barrill, Stoke Park, Ipswich.

BRAMMAS (Any variety).—First and Cup, for best pen of Cochins or Brammas, H. Lingwood, Martlesham. *Cockerels*.—First, Mrs. Barrill. Second, H. Lingwood, Martlesham. Commended, W. P. Matthews.

HAMBURGERS (Golden-pencilled).—First and Highly Commended, W. K. Tielner, Ipswich. Second, R. R. Parker, Ipswich.

HAMBURGERS (Silver-pencilled).—Second, Miss Stebbings, Lowestoft.

HAMBURGERS (Golden-spangled).—First and Cup, for best pen of Hamburgers, Mrs. Barrill. Second, W. Turner, jun., Ipswich.

HAMBURGERS (Silver-spangled).—First, Rev. F. Teale, Gazeley Vicarage, Newmarket. Second, Mrs. Barrill. Highly Commended, J. B. Bly, Lowestoft.

HAMBURGERS (Any variety).—*Cockerels*.—First, W. K. Tielner (Golden-pencilled). Second, Rev. F. Teale (Silver-spangled).

POLISH (Any variety).—Prize, Mrs. Barrill. *Cockerels*.—Prize, Mrs. Barrill.

GAME BANTAMS (Any variety).—First, Cup, and Second, for best pen of Bantams, W. B. Jellies (Black Red). Highly Commended, R. R. Parker (Black-breasted); W. Adams, St. Clements, Ipswich.

BANTAMS (Any other variety).—First, W. B. Jellies (Silver Sablelight). Second, Rev. F. Teale (White). Highly Commended, W. H. Ashford, Oulton. *Cockerels*.—First, Rev. F. Teale (Black). Second, W. Adams (Game). Highly Commended, W. B. Jellies (Black Red).

DUCKS (Rouen).—First, H. Lingwood, Barking. Second, G. W. D. Palmer.

DUCKS (Aylesbury).—First and Highly Commended, Mrs. Barrill. Second, B. Potts, Kessingland. Commended, Miss Crowfoot, Kessingland; W. Poll, Lowestoft.

EXTRA CLASS.—First, J. Worthington (Buenos Ayres Duck). Second, Hon. Mrs. Paget, Siston Rectory, Seale (California Quails). Highly

Commended, Rev. A. Gilbert, Stifford Hall, Reecles (White Peruvian Ducks). Commended, F. S. Croydon, Ipswich (Black Hamburgs).

PIGEONS.

Cup for the winner of the greatest number of points in the Pigeon classes.—L. Wren.

CARRIERS.—Cocks.—First and Second, L. Wren, Lowestoft. *Hens*.—First, L. Wren. Second, H. Lyon, Ipswich.

POUTERS.—Cocks.—First, A. W. Wren, jun., Lowestoft. Second, L. Wren. *Hens*.—First, L. Wren. Second, A. W. Wren, jun. Young.—First and Second, A. W. Wren, jun.

TUMBLERS (Short-faced).—First and Second, L. Wren.

TUMBLERS (Any other variety).—First and Second, Misses E. & A. Wren, Lowestoft.

FANTAILS (Any colour).—First and Second, F. S. Worthington, Lowestoft.

ANTWERPS (Any colour).—First and Highly Commended, D. Bedford, Kirtley. Second, J. W. Harding, Lowestoft. Commended, J. Burlington, Lowestoft.

ANY OTHER DISTINCT VARIETY.—First, Hon. Mrs. Paget (Trumpeters). Second, L. Wren (Black Dragons).

CAGE BIRDS.

Cup for the winner of the greatest number of points in the Cage Bird classes.—T. Fenn.

CANARY (Clear Yellow).—First, C. Rumbold, Yarmouth. Second, W. Jarrold, Yarmouth. Highly Commended, B. Thouless, Lowestoft. Commended, T. Fenn, Ipswich; D. Allen, Yarmouth.

CANARY (Clear Mealy).—First and Highly Commended, C. Rumbold. Second, D. Allen. Commended, W. Jarrold.

CANARY (Three Clear Yellow or Mealy, hatched in 1868).—First, W. Jarrold. Second, D. Allen. Highly Commended and Commended, W. Robbins, Lowestoft.

CANARY (Mottled Yellow).—First, C. Rumbold. Second, H. Green, Ipswich. Highly Commended, B. Thouless.

CANARY (Mottled Mealy).—First, C. Rumbold. Second, B. Thouless, Lowestoft. Commended, H. Green.

CANARIES (Three Mottled, Yellow or Mealy, hatched in 1868).—First, W. Robbins, Lowestoft. Second, D. Allen. Highly Commended, H. Green. Commended, B. Thouless.

GOLDFINCH MULE (Yellow).—Prize, H. Green.

GOLDFINCH MULE (Mealy).—First and Highly Commended, W. Scott, Yarmouth. Second, H. Green.

GOLDFINCH MULE (Three Mealy or Yellow, hatched in 1868).—First and Second, W. Scott.

ANY OTHER VARIETY OF CANARY OR MULE.—First, Second, and Highly Commended, H. Green. Commended, C. Rumbold.

JUDGES.—Rev. T. L. Fellowes, Honingham Rectory, Norwich; W. B. Tegetmeier, Esq., London; Mr. Joseph Clarke, Ipswich; Mr. W. Simmons, Yarmouth.

YORK POULTRY SHOW.

The following is the list of the awards made at this Show, held on the 8th, 9th, and 10th inst.

DORINGS (Any colour).—First, H. S. Thompson, York. Second, Lady Hawke, Pontefract. *Chickens*.—First, Rev. G. Hustler, York. Second, R. E. Russell, Bedale.

SPANISH.—Prize, F. Brown, Sheffield. *Chickens*.—First, R. Draper, Sunderland. Second, R. E. Brown, Oswaldkirk.

COCHIN-CHINA (Yellow or Buff).—Second, G. Calvert, Darlington.

COCHIN-CHINA (Any other colour).—First, J. W. Pease, Darlington. Second, G. Calvert. *Chickens*.—First and Second, R. E. Brown, Oswaldkirk.

BRAMA POOTRA.—First, W. Whiteley, Sheffield. Second, Lady Hawke, Pontefract.

GAME (Black-breasted or other Reds).—First, G. Sutton, York. Second, J. Watson, Knaresborough.

GAME (Duckwings).—First, H. M. Julian, Hull. Second, J. Sharpley, York.

GAME (Any other variety).—Second, R. Brown, Pickering. *Chickens*.—First, H. M. Julian. Second, G. Sutton.

HAMBURG (Golden-pencilled).—First, J. Walker, Knaresborough. Second, G. Holmes, Great Driffield.

HAMBURG (Silver-pencilled).—First, J. Walker, Knaresborough. Second, G. Holmes.

HAMBURG (Golden-spangled).—First, G. J. Taylor, Huddersfield. Second, G. Pounder, Kirbymoorside.

HAMBURG (Silver-spangled).—Prize, J. Walker, Knaresborough.

POLISH (Any variety).—First, C. Walker, Boroughbridge. Second, E. Proctor, Hull.

GAME BANTAMS (Any colour).—First, G. Downie, Netherton. Second, T. Blackburn, Northallerton.

BANTAMS (Faced).—Prize, J. Walker, Knaresborough.

BANTAMS (Any other colour).—First, W. Baynes, Middleton. Second, Miss Dalton, Ripon.

ANY VARIETY NOT PREVIOUSLY CLASSED.—First, R. Left, Beverley. Second, W. R. Roberts, Barnthly Wood.

TRUYS.—First, J. B. Brithwaite, Northallerton. Second, Lady Hawke, Pontefract. *Poult*.—First, S. Musgrave, Moor Monkton. Second, J. B. Brithwaite.

GESE.—First, Lord Wadlock. Second, Rev. G. Hustler, York.

DUCKS (Aylesbury).—First, J. Story, Pocklington. Second, A. G. Hayden, York.

DUCKS (Rouen).—First, C. Stamper, Oswaldkirk. Second, Rev. G. Hustler.

DUCKS (Any other variety).—First, S. Burn, Whitby. Second, Miss Dalton, Ripon.

SELLING CLASS.—First, G. Calvert. Second, J. Hearfield, Darlington.

PIGEONS.

CARRIER.—Cock.—First and Second, J. Hawley, Bingley. *Hen*.—First, J. Hawley. Second, F. J. Leach, Middlesborough.

POUTERS.—Cock.—First, J. Hawley. Second, F. J. Leach. *Hen*.—First, E. Horner, Harwood. Second, C. Cowburn, Leeds.

TUMBLERS (Almond).—First, J. Fielding, Rochdale. Second, T. Rule, Drifham.

TUMBLERS, SHORT-FACED (Any other variety).—First, J. Fielding. Second, T. Rule.

FANTAILS.—First and Second, J. Hawley.

TRUMPETERS.—First, J. Firth, jun., Dewsbury. Second, J. Mason, Boroughbridge.

BARS.—First and Second, J. Gell, York.

JACOBINS.—First, O. A. Young, Driffield. Second, F. J. Leach.

TURBITS.—First, J. Fielding. Second, G. Fletcher, York.

OWLS.—First and Second, J. Fielding.

ANY OTHER NEW OR DISTINCT VARIETY.—First, F. J. Leach. Second, E. Horner, Harwood.

SELLING CLASS.—First, J. Hawley. Second, J. Mason.

RABBITS.

LOP-EARED.—Duck.—First, A. H. Easton. Second, M. Millington, York. *Doe*.—First, S. Hardeastle, York. Second, M. Millington.

LOP-EARED (Yellow and White, or Tortoiseshell).—First, B. Hudson, Hull. Second, F. Stainburn, York.

LOP-EARED (Black and White, or Grey and White).—First, M. Millington. Second, W. S. Hornby, York.

HUMILIATED.—First, J. Dixon, York. Second, A. H. Easton.

HIMALAYAN.—First, W. S. Hornby. Second, C. Rayson, Manchester.

DUTCH.—First, T. W. Harrison. Second, S. G. Hudson.

ANY OTHER VARIETY.—First, A. H. Easton. Second, C. H. Fryden.

LOP-EARED.—First, F. Stainburn. Second, R. Dobson, York.

LONGEST-EARED.—Young.—Medal, F. Stainburn.

FROM WILTSHIRE TO GLASGOW, AND WHAT I SAW THERE.

PART I.

FROM my part of Wiltshire to Glasgow, *via* London, the best way of going is above five hundred miles. A five-hundred-mile journey in the dead of winter! Yet who could refuse to take it if they had received, as I had, a kind invitation most kindly expressed? Besides, a fancier will delight to go after the objects of his fancy.

Starting, then, by the familiar Great Western Railway, I reach the almost-as-familiar metropolis—that vast London, whose history fascinated my boyhood, and has pleased me ever since. Soft, mild, winter weather was this 7th of December. Surely Charles II. was not far wrong when he said of England, "In no other country can a man go out of doors with comfort during so many days in the year." Then, it seems our dying years' wish to be happily remembered, for their last days are so often their best days—witness this last November; while, as some one said, "He did not know which was the coldest month, May or June, but he rather thought the latter."

Next morning northward in good earnest, for my ticket reads "London to Glasgow." Glasgow—"Oh!" said a friend who just likes to tease a bit, "recollect it always rains in Glasgow, and so hard that you must take two umbrellas, for one is worn out in a day or two."

A long, long journey is before me; and how pleasant and satisfactory one feels it to be that the same carriage is to be his all the way. How calmly one sees the little travellers get out after their few-miles journey—poor short-lived beings. The very guard to a long-staged man grows into a friend, and one fancies his beard has become a little greyer since we started.

Now, it strikes me that external England should be divided in the same sort of way as geologists divide her inside. Thus, I would call the west the stone part, middle England the red-brick part, and the east the white-brick part, and so on. The red-brick is my part for a long time. Ye dull, dreary, hedge-row-and-tree midland counties, how could ye produce William Shakspeare? From you he might indeed have learned to sing of

"A mole, cinque-spotted like the crimson drops
In the bottom of a cowslip."

How the little lad at Stratford had counted time after time those five russet spots, peeping into the cowslip nosegay in his tiny hand, and finding the spots to be always five. But how, I ask, could the Warwickshire-born one learn to sing of

"Antres vast, and deserts idle,
Rough quarries, rocks, and hills whose heads touch heaven."

Or where could Shakspeare have got, he inland born, that best of epithets to describe the ocean?—"The multitudinous sea." Far better that one word than Hesychylus's "the many-twinkling smile of ocean." But why trouble about Shakspeare? He was unlike any other man. As Dr. Chalmers said of him, "he was an intellectual miracle."

On, further and further, and how the porters at the stations—(i. e., when they speak in language "to be understood of the people;" of course I do not include in that term their calling out the names of the stations)—how the porters by their brogue tell us what part of the country we are in! Cockney porters missing H's, and honestly paying them back—c. g., Anwell and Healing; Somersetshire porters giving us Z's for S's, and so on all over England.

But I have reached Carlisle at last, "merrie Carlisle," and

then all darkness, for the brief bright December day is over. My book (the "Essays of Elia"), I can see to read no longer; the talk of my travelling companions has ceased; the occasional chats are done, all liveliness is gone, and we are wearied and silent in the darkness. In that darkness, growing each minute denser, I enter Scotland, and the darkness is suitable—

"For dark, and true, and tender is the North."

Once more in Scotland after a seventeen-years absence! Yes, I am again in Scotland; for on asking a porter for a fresh hot-water tin I get an answer in the language of Burns, "Another man will bring the hot water."

It is pleasant on revisiting a formerly well-known country not to revisit the same part of it, for then it is a revisit without one painful drawback—I mean missing here and there a face, or asking for those who cannot reply, or seeing the grey hair where the brown was, or having to note the sunken cheek where, when last we saw it, stood youth, and perhaps beauty, in its rosy plumpness. Such reminiscences are painful, but happily I have none of these.

Surely the evening hours are very long hours. How very long the last two of a twelve-hours journey seem! How they, like "the tedious Alexandrine, drag their slow length along!" Glasgow—no, only Carstairs. But now Glasgow—no, only Motherwell; then Coatbridge, with its furnace all a-blaze. But the train slackens at last, and the oft-snipped ticket is broken in half, and only the return bit is left me. And how am I to know the bodily presence of my host that is to be—Mr. Huie of Pouter celebrity, known to me by several kindly letters—how am I to know him, and how is he to know "WILTSHIRE RECTOR?" Well, as usual, I carry the old recognising flag in my hand—a copy of "our Journal," and by it I am at once known. And well it was that I bore that flag, for I am not personally, as was expected, "a white-haired old gentleman with a ruddy face and a pair of twinkling blue eyes." How seldom expectations are realised! how very disappointing they are! I am only a—well, never mind my personal appearance. One thing I must say, that although the fair image of the white hair, and ruddy face, and blue eyes is at once dashed to the ground, yet I am no loser, for I get the hand-pressure of old friends from Mr. Huie, and Mr. Ure, and the ring of fanciers who kindly meet me—me a stranger, only known by some vagrant trifles, kindly written, I hope, in "our Journal." N.B.—I had not to put up my umbrella, so it does not always rain in Glasgow.

A drive of two miles or so through the long lines of gaslamps, and I reach Mr. Huie's villa. A pleasant villa I soon found it to be, where I get a warm-hearted welcome. A Scotchman does not let his shake of the hand dwindle down to a two-fingered affair, neither does a Scotchwoman give four cold, straight fingers that chill the very life-blood. At once I am at home. I fear, ye great ones of the earth, ye kings and queens, ye cannot make your friends so at home. I hope you can, for their sakes and for yours. The needed supper is all ready, and then soon followed the needed bed.

Next morning, December 9th—N.B., no umbrella wanted; how could that old bachelor friend alarm me so much, and so falsely too? Well, next morning, on looking garden-wise, I see extending from either side of the house long greenhouse-looking buildings wired in the front. These are the pigeonries, so placed that from the bow windows you command a good view of the birds. The enormous size of the Pouters strikes me at once, then the deep richness of the Reds and Yellows. A closer view after breakfast tells me of peerless Fantails, peerless in carriage and motion; good Almonds, Jacobins, &c.

But we are off from Rowan Cottage to Glasgow. Upon this, the commercial capital of Scotland and the largest city of the empire next to London, you see plainly inscribed the wealth and intelligence of its inhabitants. Width of streets, length of streets, all modern, save here and there a crow-stepped gable or two; but the new quite overpowers the old. The streets are in width what Sir Christopher Wren wished, but wished in vain, to make the streets of London. I must single out a few of the Glasgow streets: Argyle Street, the city's great backbone; lengthy Eglinton Street; and Buchanan Street, the Regent Street of Glasgow. Straight we go to the Exchange, where business faces are around me, business telegrams before me—earth's occupations, and earth's only. By a strange yet fitting contrast we go next to the old cathedral, which looked down on Glasgow as a mere little town, and now looks down on its vastness. This is the only cathedral, save that of Kirkwall in the Orkneys, which was saved from the destroying hands of an unreasoning populace. Glasgow Cathedral is a massive pile

of the heavy earlier, and not late and lighter Gothic. It inspires awe, it forces the mind into respect. Of recent years it has been restored, but indeed as to the fabric it is so strong it needed little repair. But dirt and rubbish are gone, and every observable window in all parts, crypt as well, is of stained glass. In massiveness, as opposed to lightness, it is the very opposite to Salisbury Cathedral. On this dark but dry December day, a "dim religious light" did indeed pervade its interior. The painted windows have, many of them, an unusual but desirable practical bearing. Thus, a sick-bed scene with a motto text, instructive to the looker and reader. Then the faces and figures are natural and human, not mediæval angular distortions. The one thought that overcomes all is massiveness—how solidly built it is!

"They dreamt not of a perishable home
Who thus could build."

Down to the crypt—clean, yet how cold!—I stand by St. Mungo's Well, the Saint to whom the building was dedicated. I am placed by the pillar where Rob Roy gave the warning to Frank Osbaldistone. How Scott (Oh! triumph of genius!) has made us talk of the scenes in his fictions as if they were very facts. I linger as long as I dare in this wonderfully built crypt. A lancet window startles me. It has a picture of the Baptist—a wild, weird-looking, camel-hair-covered figure in the attitude of preaching, with the text "Repent ye," &c., beneath—a strange haunting figure. I am bidden to stoop and read a small brass. It briefly tells me that Edward Irving is there buried. How suitable a resting-place for that fiery day! How suitable a window above his grave!

Further wanderings about Glasgow fill up the day. I mark the hill on which stood Queen Mary and saw the fatal defeat of her troops at Langside; then on to the Western Park—what a noble view from its noble mansions! Then I walk by the Kelvin (what a place for summer-evening wandering!), then to the busy Docks, and view the once rural Clyde, now the Clyde vessel-laden. On still sight-seeing, passing tempting Glasgow shops. But daylight fails, and I rest, nothing loth, at the Henover Hotel, for there I am to be present at the annual dinner of the North British Columbarian Society. N.B.—No umbrella used the whole day.—WILTSHIRE RECTOR.

TUMBLER PIGEONS.

WITH all deference to the opinions expressed by "WILTSHIRE RECTOR" respecting the homing faculties of Tumbler Pigeons, I beg to differ from him. I could mention several instances in which they have come home short distances. In the early part of last year I sold some Tumbler Pigeons to a gentleman living at Horsham: amongst them was a White Roller cock, and this bird had no sooner regained his liberty than he returned home, a distance of about eighteen miles. He was quite pure-bred, and had never been trained.—L. B.

THE SUNDERLAND BIRD SHOW.

SUNDERLAND has at last spoken, and her Committee has sent out its schedule of prizes for the next great Ornithological Exhibition, and as a whole the schedule is a good one, but I think a few alterations might have been made with advantage. There is no class either for London Fancies or Crested Belgians. Now, the former every one admits to be a pure breed, whatever may be said about the latter, and I do think that it ought to have had a class before that mongrel the Scotch Don, which is honoured with four. The schedule stands alone in the way in which the Mules are classed. Here they are divided in a manner they deserve to be, which shows both the common sense and discernment of the Committee in general, and of Mr. Blakston in particular.

Goldfinch and Linnet Mules, especially the former, are birds which every fancier likes, and which every fancier knows are more difficult to breed good than any other cage bird, and when good are most valuable, and Sunderland was the first place, indeed, is the only place, where their merits were acknowledged and prizes given to them adequate to their pretensions. I hoped to have been able to show the world at Sunderland a couple of perfectly clear Linnet Mules (the first, I believe, ever exhibited), but, unfortunately, they would not moult, and died.

I beg, in conclusion, to remind old exhibitors, and to tell all Canary fanciers who have never been to Sunderland, that the way in which exhibitors are treated, the way in which the specimens are looked after, and the kind and courteous manner in which all the Committee and Mr. Blakston behave to their

Friends, cannot be surpassed, if equalled, at any show in England.

All you who show at the Crystal Palace, you great fanciers of the far south, go to Sunderland this time, and show by your presence that you appreciate the exertions of the Secretary; and if you cannot and will not go, send your birds, and depend upon it you will not be disappointed, even if you do not take a prize.—HOWARTH ASHTON, *Polefield Hall, Prestwich.*

COLOURING CANARIES FOR EXHIBITION.

It is but a year or two ago that an exposure was made of a case of "artificially colouring birds" sent for show at an exhibition of fame in the North of England, and a year or so previous to that occurrence a case came to my notice of some birds having been bought from a man in the neighbourhood of Norwich by respectable persons residing in Gloucester, who innocently but unfortunately exhibited them at an All-England Show in Gloucester. These birds were found by the judges to be stained, which fact was proved to have been the case before arriving in the hands of the Gloucester exhibitors. Notwithstanding the name of the offending person having been given, I regret to say there were those living in Gloucester at the same time who were ever ready to damage the position of those who purchased and exhibited the birds. Now, at an exhibition held in Gloucester on the 9th instant and following two days (open to residents within forty miles of the city), I am sorry to announce two cases of stained Canaries were found out and exposed, one of which was shown by a person residing near Bristol, and the other by a Gloucester exhibitor. I think the sooner such practices are checked the better the bird cause will flourish.—DETECTIVE.

GOLDFINCH MULE CANARIES.

UNDER the above heading I have noticed an article in your Journal of November 19th, from Mr. W. A. Blakston, but I suppose he is referring to, or means, Goldfinch and Canary Mules. He states, "In some schedules 'nearest the Canary' is the standard—a definition so manifestly absurd as to need no comment." This condemnation I cannot entertain, for, "absurd" as it may appear to him, it is not absurd to others. He says (and quite correctly too, and giving preference in this particular instance to a bird "nearest the Canary"), that "the Mule most difficult to breed is one absolutely clean, and it therefore ought to occupy the highest position." Undoubtedly so, for if a schedule is issued with only one class for Jonque Goldfinch Mules, and one for Mealy Goldfinch Mules, I should decidedly think of awarding the first prize to the one "nearest the Canary," if that specimen were a clear or clean Mule. It most certainly would take precedence over other Mules. Even-marked Mules demand more attention than those odd-marked, but still evenness of marks does not always over-rule a bird. Much depends on the state or condition they may be in. Committees and Secretaries are, I am happy to say, gradually framing their schedules to one state of things, so that an exhibitor will know full well how to enter birds.

Clean Mules, and even-marked ones, should not be classed together. If there were sufficient clean Mules bred, I would (as provided by the very excellent schedule just issued for the next Sunderland Show), rather see them in classes away from any other, but owing to their scarcity, I prefer them as in the last Crystal Palace schedule, where classes are provided for clear Mules, or those only slightly ticked or marked, but a clear bird for choice of either. Having a class entirely for clear Mules is proof positive that there will scarcely be any entered, which not only bears a scanty appearance, but then it affords temptation, if an unfair exhibitor should be possessed of a specimen with but one slightly-ticked feather in the bird, to pluck it out, and show it as a clear specimen.

I have no doubt it would be annoying to Mr. Blakston to notice at the "local show" he alludes to, a bird marked on one wing displacing an even-marked bird; but the fault lies with those who issued the schedule in not providing proper classes. It would be more satisfactory, especially to the Judges, if this were done.

Mr. Blakston having mentioned my name in the latter part of the same article, and stated he had no doubt that myself, with others (Mule-breeders), would exhibit some at the winter exhibitions, I embraced almost the only opportunity, owing to my engagements as a Judge, of answering his call. I entered some of my Mules at Belford Show, and had the satisfaction of taking

a first prize with my even-marked Jonque Goldfinch Mule, "Lord Derby," and winning a second prize with a fine even-marked Mealy Mule, "The Pride of Derby."

In your following number I shall be glad to give a few remarks on Mule-breeding with the Goldfinch and Canary.—G. J. BARNESBY, *Derby.*

SCHIEBERLE'S METHOD OF CURING FOUL BROOD.

At the meeting of German bee-keepers held at Brünn, in September, 1865, the Rev. Mr. Schieberle stated that he had invariably succeeded in curing foul brood by the following mode of treatment:—

"We first excise all the combs to the very last cell, by which means the bees are compelled entirely to refurnish their hive, whilst the queen cannot immediately recommence egg-laying, and then leave them alone during the first night in order that they may lick up all the spilt honey, and clean their hive, which they will do most industriously. We then take thyme (*herba Serpylli*), and white balm (*Fol. Melissa*), if possible in the green state, with some leaves of aloe (*Aloe socotrina*), and boil the whole in water for some time. The liquid strained from this decoction diffuses an agreeable strengthening odour, and being mixed with a sufficient quantity of honey to qualify it for bee-food, must be again boiled, and well skimmed. We next grate into a feeding-pan a piece of assafoetida about the size of a hazel nut, and a bit of camphor as large as a pea, add to it a little sulphate of magnesia on the point of a knife, and pour upon this a good pint of the hot decoction; lastly, we add some drops of oil of turpentine, and stir the whole well together.

"The mixture thus prepared is presented to the bees in a tepid state, and these, attracted by the smell of the honey, and feeling its necessity for comb-building, proceed immediately with a glad hum to the feeding-pan. But soon their gay humming ceases as they retreat after tasting the food. Still, however, they return again, one by one, in order again to taste it, until, perhaps, at this first time a third or a fourth part is removed according to the strength of the colony; we then warm up the food again, and present it to them anew. In the meantime the penetrating odour of the assafoetida and camphor has permeated the entire hive, and the bees, becoming accustomed to it, have also prepared new combs for the reception of honey. For this reason they appropriate yet more the second time, and if we continue to offer them such food they will learn to remove the whole of it forthwith. When they have once entirely emptied the feeding-pan we need only pour the honey on the undissolved part of the camphor and assafoetida, adding at the same time a little sulphate of magnesia, and a few drops of turpentine, and stirring the whole well together.

"But on one point we must be very careful, and that is that we do not attract strange bees, either during the excision of the combs or by feeding, since the colony whilst it has no combs is by the intrusion of strange bees easily induced to desert its hive. We therefore remove the partially emptied feeding-pan every morning, and having warmed the food, replace it in the evening. If, however, the pan be quite empty, and there are no particles of comb therein, there will generally be no danger from strange bees, and we may leave it during the daytime also, in order that the hive may become penetrated by the scent of the camphor and assafoetida."

"The bees soon prove that they are cured by their active and industrious flight during the day, as well as by the rapidity with which combs are constructed, the brood is duly matured, the colony prospers, and no trace of foul brood is discoverable, although the bees remain in the same hive, and this latter on the same spot. Nay, I have already used in this way without injury the honey from foul-broody hives, and one of my restored stocks completely cleared out the honey from the combs of two foul-broody hives which had been excised, and deposited in a room on the ground floor, the window of which was, in my absence, left open by a servant. This stock threw off two swarms during the same year, nor was it infected in the slightest degree. It is, therefore, perfectly unnecessary to destroy anything except the brood-combs from foul-breeding hives. According to my opinion and experience, infection only occurring by means of infected bees from a foul-broody stock wandering

⁴ For this reason it would appear necessary to place the feeding-pan within the hive itself, instead of on the top as is usually done in England.—Eus.

to other hives, partly owing to a dislike for their own dwelling, and partly in order to rob, when if they like it, there they remain, and thus inoculate the stock with disease."

FOUL BROOD.

I ENTIRELY CONCUR with the views expressed by Dr. Preuss on foul brood in the article which appeared in pages 311—313. I can, in fact, corroborate the whole of his statements; and believing him to be perfectly correct in his theory, I will, for the benefit of your readers, describe a few experiments which I have made.

I may in the first place mention, that I believe without doubt that the cause of foul brood is a certain degree of heat combined with a certain amount of moisture—that although foul brood may be engendered in a hive with a moist heat of from 70° to 90°, a hive with a perfectly dry heat even as high as 100° will remain healthy. I believe it to be to a great extent a law of nature, that animal life is destroyed by fungi; whereas in vegetable life it is only after death, or when the vitality of the plant has been impaired by some cause, that fungi appear. I have from time to time mentioned that I had used combs from infected hives with impunity, no bad results having followed; but as I had reason to believe that these statements were not credited, I for that reason refrained from describing how I effected it. Had these statements been favourably received I should have given publicity to my views before this. Having, therefore, in the first place discovered that a fungus was the cause of the disease, I was not long in finding a cure; and this was effected by simply drying my combs and hives in an oven or stove, exactly as described by Dr. Preuss, which is a very effectual mode of destroying many fungi.

I will now briefly mention a few experiments which I have made with foul brood. First, drying the combs is an effectual cure. Taking a piece of infected comb from a hive and giving it to two others was in one case fatal, whilst in the other nothing went wrong, owing entirely to the state of the hive at the time, just in the same manner as a piece of Mushroom spawn will live in one place and die in another. Again, by inoculating other hives I have found that in some cases nine weeks elapsed before foul brood appeared, but in most instances symptoms of the disease showed themselves in six weeks, and in three weeks the fungi could be easily detected.

I thus submit my views to the readers of "our Journal;" and although confident in my own mind that I am correct, I do not expect other apirians to receive them against their own convictions. I merely state my mind frankly on the subject, and wish other bee-keepers to do the same, neither condemning nor approving anything I have said until they have proved it, since it is only by observation and experiment that we can arrive at the truth.—A LANARKSHIRE BEE-KEEPER.

[It must be remembered that Dr. Preuss recommends that infected hives should be kept for some hours exposed to a temperature equalling that of boiling water (212°); and if we bear in mind the fact that the melting point of ordinary bees' wax is as low as 142°, it appears very unlikely that a degree of heat which would destroy the vitality of fungus spores, would not at the same time prove fatal to the structure of whatever combs might be submitted to it.]

OUR LETTER BOX.

JUDGES AND COMMITTEES.—We have so many letters concerning the alleged misdoings of these officials, that except in flagrant cases we cannot afford space for them.

HAMBURGH COCKEREL (H. C.).—As he spins round and holds his head on one side, there is pressure on his brain. He is probably too fat; feed him for a week or two on mashed potatoes, boiled rice, and very little barley meal. Give no hard food, and keep him quiet. If no blood vessel has ruptured he may recover.

POULTRY HOUSE (S. S.).—If you enclose seven postage stamps with your address and order "The Poultry Book for the Many," you will have it sent free by post from this office. It contains plans to suit you, and much useful information besides.

A TURKEY FOR COOKING (A. K.).—About the end of the year in which it was hatched a Turkey is best for table; but it is good for table purposes until it is more than twelve months old.

POLANDS FLOCKING EACH OTHER (St. Edmunds).—You must separate the Poles. A good supply of fresh mould, and green food, especially lettuce, lessen their inclination to peck each other. It is generally considered the work on Pigeons published at our office is the most useful.

POULTRY ON A 200-ACRE FARM (J. Mason).—You may keep any number of fowls in season on such a farm as you describe—three hundred easily. From your account they are at present, if managed at all, very much mismanaged. You will only obtain eggs in winter from pullets, not from hens, and they must be watched to see that their eggs are not

stolen. It is ridiculous to talk of one hundred eggs from one hundred hens in the laying season. They cannot lay less than three hundred. The best laying breeds are Spanish, Brahmas, and Creve-Coeurs. We believe the second will suit you best, although they are sitters. They are very hardy, excellent layers, and not large consumers of food. No fowls require meat-feeding; and with the appliances of a farm of three hundred acres, the feeding at barn doors where threshing is going on, under ricks in a stackyard, and the run in hedge and ditch and over meadow, should nearly supply them with food. If looked after we believe the eggs will pay a good profit. Hens are like many other things—they will pay well if well looked after; but if neglected they acquire bad habits, and are never profitable.

COMB OF COCHIN-CHINA COCK (Lemon Begg).—The "Standard of Excellence" is not an authority in poultry-judging. The comb you describe and figure is hardly a disadvantage, much less a disqualification.

LA FLÛCHE—SPANGLED HAMBURGH (Goschurck).—La Flèche hens should weigh more than you mention. It was a bad class at Birmingham. A moult will most likely remove all the spots from the saddle of the Spangled Hamburg cock; they are the last signs of youth. Your Dorings should weigh from a pound to a pound and a half more at their age, but there is nothing to hinder them from being prizetakers when they are older.

BRABMA POOTRAS (Brahmas).—You cannot expect to buy a prize Brahma pullet for 15s. It is not the value of one. A good specimen should be heavy, short-legged, well-feathered; have a well-pencilled hackle, well-pencilled body and breast, good fleshy thighs and hinder parts, well-feathered legs, and a pen comb.

COLOUR OF BRAHMA POOTRAS' EGGS (Dum).—The colour of the eggs of this breed varies; some being lighter at times, darker at others. Just so in borkings: they sometimes lay cream-coloured eggs. The cause has never been ascertained. If your Brahma cock twist the end feather of his wings it is not from weakness. It is an incurable defect. No amount of feeding and no skill in treatment will cure it. It is hereditary.

GAME COCK'S WINGS DROOPING (M. T.).—We know nothing that would cause a droop-winged bird to carry them up. We would neither keep nor breed from such a bird. The damage of three or four wing feathers is quite immaterial. The third is a far more important accident. In close competition it would decide against the bird. Perfection is nearly necessary for success in the Game classes.

COCHIN-CHINA COCK LAME (J. W.).—If the bird is an old one he is probably breaking up. Cochins are not long-lived, and when they begin to fall away they do so rapidly. We advise you to put him in a dry place, and to feed him well with soft food, part of it being bread and ale. If he do not mend in a week we should think badly of him. All the birds are perhaps suffering from change of air, diet, and water. Give them all daily stale bread steeped in strong beer.

WRY-TAILED FOWLS (G. M.).—A wry tail is a disqualification in any breed. Do not breed from him. No defect is so certainly transmitted.

BLACK AND GAME BANTAMS (Endeavour Exhibitor).—Game Bantams must be Game fowls in miniature, and possess all their characteristics. Coarse heads, drooping wings, and redundant tails are the things to avoid. Black are subject to the same rules. Double combs are disqualifications.

CHOICE OF COCHIN-CHINA COCKERELS (J. M.).—Breed from the moderate-sized bird that is perfect in colour and shape. Put him to the hens that have thrown the large birds, and you will probably obtain all you require.

CLEANING WHITE FOWL'S PLUMAGE (Inquirer).—Wash the plumage with soap and water. As it is only the outer part of the feather that is dirty, you must wash them by wiping them downwards with flannel dipped in the soap and water. They must then at this time of year, when there is no sun, be put in a basket with some hay or soft straw, and placed before the fire till dry. Their legs should be washed very clean.

VARIOUS (F. K.).—Black feathers in the tail of a Buff Cochin cock will not disqualify at a show. No; a hen would lay as well if there were no cock. Ground oats are excellent food for pullets, kitchen scraps also, and meal mixed with milk. Stimulating food is injurious. Your Cochin pullets will lay within a fortnight.

SOFT EGGS (W. H. B., Whit-haven).—Your Brahma Pootras lay soft eggs because they are too fat, which arises from your "feeding them very plentifully" for exhibition. This is a great mistake, fatness is not high condition.

PIGEON JUDGING AT BIRMINGHAM.—"I am exceedingly obliged to Mr. Harrison Weir, and I beg to explain that by a typographical error, I was made to say, 'I wonder how the three [judges] managed with 120 pens more than last year.' It should have been, 'And I wonder how the three [judges] managed last year with 120 pens more than this year,' meaning, of course, that though there were this year 120 pens less than last year, the four judges had quite enough to do.—A FOREIGNER."

BREEDING FROM A WEAK-EYED CANARY (H. A. J.).—If the hen be a favourite or of a very valuable strain, breed from it and run the risk, but if it can be replaced by a bird in a healthy condition, we should rather recommend the latter course. The affliction may arise from cold, and we do not apprehend it will be hereditary.

LOPE-EARED RABBITS.—"One Who Wishes to Know the Reason Why," asks if a new law or rule of excellence has been introduced for the guidance of the various judges of Lop-eared Rabbits, as the judgment at the late Leeds Show appears to have been guided by entirely new points of merit, ignoring the two points hitherto considered essential—viz., length and width of ear.

A CANNIBAL DOE RABBIT (W. D.).—If a doe persists in eating her young ones, despite your changing her diet, we know of no remedy.

THIS YEAR'S SWARMS FIGHTING (M. J. L.).—The fighting is, doubtless, owing to the hives being too near together, and the bees mistaking them in consequence. Nothing should be done to remedy this until they are in full activity next season, when the hives may be moved very gradually further apart. It may be as well to contract the entrances in the meantime.

SNAKES AND ADDERS.—"How can I destroy snakes and vipers, as in some places here they are rather too numerous? If by poison, how and when? Is there any other method? What is their principal food, and how at the present time to find out their winter abode?—A. MACTARLANE."

From observations taken near London during the last forty-two years, the average day temperature of the week is 41.9; and its night temperature 30.6. The greatest heat was 57°, on the 3rd, 1869; and the lowest cold 11° below zero, on the 4th, 1867. The greatest fall of rain was 0.86 inch.

BEDDING, WITHOUT WINTERING PLANTS UNDER GLASS.

LONG ago in my native village there was a crazy man, who used to walk about crowned with an immense hat so thickly stuck over with tall showy peacocks' feathers that little or no hat could be seen, and our worthy clergyman once made use of this funny head-gear to point a moral, by remarking that "were we all to carry our follies as prominently exposed to public view, there would be many stranger figures in the town than poor Sandy." Well, here is a great feather, and there are very few hats without it. We are one and all of us, from his Grace's gardener down to the doctor's boy who sorts the garden, as well as the pigs and the pony, awfully, hopelessly imitative. We steal one another's spent thunder, and thunder it over again with as much zest as if it had never before shaken our little gardening atmosphere; we keep running in a circle, treading on one another's heels so closely, that were our neighbours in other walks of life not similarly engaged, they would set us down at once as a lot of mere copyists. But it is not pleasant to dwell upon the weak points of human nature at any time, and much less at this supposed merry time of the year; and after all, if we copy only what is good in our betters, so much the better for us, and if in addition to that we imitate also their whims and weaknesses, our doing so only tends to keep down a crop of whimsicalities entirely our own.

Whether we owe the wide-spread habit of massing plants together in great numbers, so as to produce sheets of colour, to imitativeness or to the innate instinctive love of flowers on the part of the many, I cannot tell; it is enough for us to know and congratulate ourselves on the fact, that flowers from being what they once were, luxuries of the few, would seem to be now almost necessary to the happiness of every one who possesses a garden. The will and the way, however, are two very different matters. Many a man's love of flower gardening has evaporated, leaving him hard and dry, whilst looking over his first bill for bedding plants at 4d. each; and many a gardener's praiseworthy ambition has grown into disgust by his attempting the wizard trick of turning a miraculous number of half-hardy bedding plants out of one or two tiny houses; yet a great piece of the road to perfection can be passed over without the help of houses at all. Last summer I saw and made notes of more than one flower garden furnished with plants, the tenderest of which had only experienced the slender hospitality of frames and hand-glasses, and many—and these not the least striking—did not require even that. The sight of one of these glassless places in particular gave me an attack of "wholesome humility," from the effects of which I have not yet recovered.

Our list of bedding plants which, being either hardy or annuals, do not require wintering under glass, is growing longer every year, and we have, besides, a long list of plants with ornamental foliage, many of them hardy enough for the Hebrides, and handsome enough to hold up their heads beside the best of those half-hardy plants

we are accustomed to use. Of hardy perennials may be quoted:—

Viola cornuta	Saponaria oeymoides
Viola lutea	Oenothera macrocarpa
Pansies, Cliveden Blue	Nepeta tenerifolia
and Yellow	Calceolaria Gem
	Delphinium formosum.

Almost lost for want of patronage, that *Oenothera* is a most showy plant; the flowers are large, 2 inches or so across, and of a delicate yellow, something like those of *Calceolaria amplexicaulis*; they are produced in great profusion considering their size, and in succession from June to the end of September. The plant is of a prostrate habit, rarely rising more than 10 inches in height, with leaves of a bright glaucous green. It is best propagated by seeds, layers, or cuttings of the roots, cuttings of the shoots striking but indifferently.

Calceolaria Gem is a most abundant bloomer in autumn, but unless the plants are forwarded under glass in spring, they do not count for much during the summer. If left in the ground during winter, the plant requires a little protection. The flowers, which are very numerous, are dark red.

Of hardy ornamental-foliaged plants we have the following, which may be kept by everybody:—

Cerastium tomentosum	Crimson and Purple Beet
Arabis lucida variegata	Sachys lanata
Arabis alpina variegata	Dietylis elegantissima nana
Polemonium caeruleum variegatum	Santolina incana
Sedum acre variegatum	Lonicera aureo-reticulata
Sedum Sieboldi variegatum	Ivy, variegated sorts
Tussilago farfara variegata	Variegated Balm
Serophularia nodosa "	Variegated Strawberry
Festuca glauca	Variegated Sage
	Purple Orach

To these many more might be added. There is one in particular, of which I have a small patch on trial, but its green-leaved progenitor is so thoroughly detested by all honest people that I almost fear to write its ugly name, yet the variegated form of *Eigopodium podagraria* is a beautiful-leaved plant if it can be kept under control. The Variegated Strawberry, too, is no mean rival to *Mangliesii* *Pelargonium*. Our great want in this section is a good purple-leaved plant, something like *Iresine Herbstrii* in habit and colour, but hardy as a Colewort. There is the Purple Orach, but it is tall and coarse, and except when very young, not very ornamental. We have also a dark-leaved *Ajuga*, hardy enough, but rather mean-looking, so that for our sombre shades we must fall back upon "that vulgar thing" the Purple Beet. Will nobody invent another name for it, something with an Oriental smack; and then we shall be at liberty to use one of the best dark-leaved plants known. The little brown *Oxalis* is not altogether hardy, and is further unfortunate in being only a mere weed, differing little in colour from the soil it grows in.

The following are annuals, or plants treated as such, which, if sown in spring, will flower during the succeeding summer and autumn. Those marked * can be sown in

the open air about the beginning of April, the others in a cold frame or under hand-glasses :—

Ten-week Stocks	Nasturtium Crystal Palace Gem
East Lothian Intermediate Stocks	Petunia, dark
Tagetes signata pumila	Nycteria selaginoides
French Marigold	*Saponaria calabrica
*Nasturtium [Tropaeolum] compactum	Kauffussia amoloides
Nasturtium Tom Thumb	Brachycome iberidifolia
	Jacobaea, various colours
	*Sanvitalia procumbens
	Ageratum mexicanum

With a hotbed, by sowing the seed in February, *Lobelia speciosa* and *Verbena venosa* may also be had, but without these the list affords ample materials for making a rich and varied show. *Nycteria aelaginoides* is a white-flowering Verbena-like plant, which continues in bloom for the greater part of the season; it is of a dense compact habit, and well fitted for making lines in ribbon borders or edging large beds. *Tagetes signata* makes as fine a yellow bed as the best of our *Calceolarias*, and it does not go off as these sometimes do. Its blooming powers are something wonderful. From its seedling state until frost takes it, it continues one flush of yellow.

While I am fully aware that none of the plants mentioned are qualified to take the place of our idolised *Pelargoniums* in the flower garden, yet if they are skilfully combined, themselves and their surroundings well attended to, and especially if they are employed on a somewhat large scale, it will be found that a most imposing display may be had without wintering a single plant under glass.—*AYRESHIRE GARDENER.*

FLOWERS OF THE PAST SEASON.—No. 1.

GLADIOLUS.

The past season was a very trying one for this beautiful autumn flower, and my notes about it are to be taken with reserve. I was enabled to grow all the best of the new varieties, and here give the result of my observations, remarking that they tally very much with those of my friend Mr. Banks, of Sholden Lodge, Deal, and I believe with those of Mr. Kelway, of Langport, also.

1. *Bernard de Jussieu*.—Violet ground, shaded and tinted with cherry red and purple. The colour is new, but neither the form of the flower nor the disposition of the spike is good, and I should certainly class it as a second-rate flower.

2. *Etendard*.—A well-formed flower. Spike long and well-arranged; white, lightly tinted with lilac.

3. *Eugène Scribe*.—Tender rose, flamed with carmine red.

4. *La Fiancée*.—Beautiful clear white, with small bluish violet spots.

5. *Molière*.—Cherry red, with white spots. A very good exhibition flower.

6. *Mozart*.—Lively rose, lightly tinted with violet, flamed with carmine. A very desirable variety.

7. *Princess Alice*.—A pretty shade of colour, light lilac; perhaps a little too washy.

8. *Rossini*.—Dark red amaranth, lined and spotted with white.

9. *Semiramis*.—Of a beautiful colour, but in other respects it has greatly disappointed me; the form was defective, and the spike lanky. I should be sorry to think that my favourable opinion formed of it was wrong, and hope it may be better next season.

10. *Thunberg*.—Flowers large, perfect form, reddish orange with white spots.

11. *Ulysse*.—This I think the best flower of the season. The flowers are well disposed on the spike; the colour a clear bright rose, spotted frequently on the lower segments. Very beautiful.

12. *Uranie*.—Clear white, largely flamed with lively carmine red. Very fine variety.—*D., Deal.*

CUCUMBER CULTURE.—No. 2.

FRUITING BED.—Dung for the fruiting bed must be prepared as for the seed bed. The bed should be made a fortnight or three weeks after the seed is sown, according to the time of year, allowing a greater interval early in the year than later. When seed is sown early in February, the fruiting bed should be made twenty-one days afterwards, or in the third week, so as to be in a fit state for the plants by the end of the month, or at latest by the beginning of March. If seed is sown at the end of February, or beginning of March, the fruiting bed ought to be made up in ten days or a fortnight, so as to be ready for the

plants when large enough, which is after they have been stopped, and have made shoots about 2 inches long, always having the fruiting bed ready for the plants by the time the heat in the seed bed is becoming too low for their free healthy growth, for the plants must be kept gently growing, and, if possible, without a check from cold, whilst over-excitement from too great heat is equally, if not more, injurious.

It is very desirable, where there is an abundance of leaves, to mix a quantity with the dung. They prevent the heat becoming too violent at the commencement, and render it more lasting. The leaves should be equal in quantity to the dung, and should be moist, and, if possible, well mixed with the dung before the bed is made up. Horse or stable dung alone is apt to become very hot, often producing a heat of 160°, or more, but by mixing with leaves or half-spent dung the heat will be moderated. Fresh cowdung mixed with stable dung only renders the heating more violent. The bed should be carefully made up, well mixing all the parts, shaking them out evenly and regularly, and beating them well with a fork, finishing off the bed with the finer materials.

If the bed is made at the end of February, it should be 4 feet high in front, and 4½ feet at back; if early in March, 6 inches less in height; if at the end of March or beginning of April, a foot less than in February, whilst 2 feet 6 inches will serve very well for May. The bed being made, put on the frame and lights, and keep the latter close until the heat rises, then fork over the surface to the depth of about 9 inches, which will allow of the heat rising to the surface by keeping the material light, and permit the rank steam to escape, the lights being left open about an inch for that purpose. In about a week it will be seen whether the heat is likely to become too violent, a thermometer being plunged for that purpose in the dung to the depth of 9 or 12 inches; and by noticing its readings for two or three days it will be seen by the rapid rise or steady temperature, whether the heat is likely to be too violent or not. If too hot the fermentation must be checked, removing the upper part of the bed for about a foot in depth, and watering the part beneath, but not so as to chill the bed; yet give enough water to check the fermentation, and prevent the bed heating itself dry. Forking over the surface of the bed every second or third day, will not only sooner fit it for the reception of the plants, by preventing too violent a heat, but tend to render it sweeter, the rank steam being as injurious to the plants as too much or too little heat. Taking proper means to prevent the generation of too much heat after the plants are put in, is an important part in Cucumber culture.

If the materials are properly prepared, and the surface of the bed turned over as above described, there will be little to apprehend on account of rank steam. When the temperature of the bed at 6 inches from the surface does not exceed 90° after the bed has been made a week, or from that to ten days, it will not be liable to rise higher; but though that heat is too high for Cucumbers, we must bear in mind that the fermenting materials instead of increasing decline in temperature, therefore it is desirable to commence with the heat rather too high, taking the necessary precautions to prevent injury to the plants. When soil is placed in the frame, and raised in the centre of each light in the form of a cone, the soil at the base of the cone may have a temperature too high for the roots of the plants, but higher up it may not be warmer than is needful.

When the temperature of the bed is reduced to 90°, at the depth above indicated, and is not likely to rise higher, prepare the bed for soil. I take off the lights and frame, and rectify any irregularities resulting from the heating or settling of the materials, filling up the hollows with fresh but properly prepared hot dung, and making the surface quite even and firm by beating with the fork. I then replace the frame and lights, and under each light put a barrowful of soil, taking care to have it moist, especially early in the season, but more inclining to be dry than wet. It will absorb moisture in addition to heat from the bed, and if used wet becomes too much so, and the plants will grow too succulent and tender, and be ill-adapted for withstanding powerful sun and air, which latter at an early season is not always so warm as desirable. The soil is placed all over the surface of the bed, allowing a barrowful to each light or space 6 feet by 3 feet, and after being in the frame twenty-four hours, the lights being kept close, draw the soil into hillocks exactly under the centre of each light, which will leave a little soil over the dung, and prove advantageous in keeping down the steam, but the thickness of soil left ought not to exceed 1 inch. The hills should be raised so that their tops will be precisely 6 inches from the glass. Next day

the plants may be placed in the frame, but do not plant them out, merely stand the pots on the soil at the back of the frame, and you will have an opportunity of testing the heat whilst the plants are becoming accustomed to the temperature and atmosphere. A thermometer ought to be kept in the frame; indeed, two are requisite, one to determine the bottom heat, and another the top heat. If the bottom heat in the hills does not exceed 85° or 90°, put out the plants, one under each light, or in each hill, with the ball entire; let the hill be formed somewhat flat, and slightly dished so as to hold water. The plants should be planted slightly deeper than they were in the pots, but avoid planting too deeply. The hills should be about 1 foot in height.

After planting, if the soil is not sufficiently moist give a gentle watering, but avoid making it wet, and have the water the same in temperature as the air of the frame. Some put two plants under a light. I think one better, though for early fruiting, and when the plants are not expected to continue long, then there may be an object in planting two in each hill, so as to sooner fill the frame, otherwise one plant will produce as many fruit as two plants in the same space, and the fruit will be finer. The temperature of the atmosphere of the frame should be from 70° to 75° at night at the commencement, for it is desirable to afford a brisk heat so that the plants may become speedily established.

TEMPERATURE.—After planting be watchful to secure the proper top and bottom heat. For a time both will be sufficiently high, if anything too high, but afterwards the heat in the fermenting material will begin to decline. The bottom heat ought never to be less than 70°, better 75°; and 80° should be the maximum, though it may, for reasons above given, be somewhat higher at the commencement. The atmospheric or top heat should be from 65° to 70° at night, and not less than 60°, which ought to occur but seldom, as, for instance, in the case of sudden and severe frost. By day the temperature, ever dependant on that of the external air, will be variable; its minimum, however, must not be less than that of the night, and it is better to keep the plants in darkness, by not removing the covering, or by replacing it sooner, for a longer period each day than, by taking the covering off, to allow the day temperature to sink below that of the night. The temperature by day must never be allowed to exceed 80° without admitting air, and though it may afterwards rise to 90°, such a temperature without air would be ruinous, and yet with air high temperatures are beneficial. The temperature, therefore, by day may range from 65° to 70° or 80° without air; but if it be practicable to give a little air without lowering the temperature after it has risen to 75°, it will be very beneficial to do so. In the day, therefore, the temperature should be from 70° to 75°, with a rise from sun heat to 85° or 90°.

The bottom heat must be maintained by adding linings to the bed before the heat has too much declined, as if the heat be allowed to fall too low the plants will probably suffer, for the lining will be a few days before it warms the bed. The lining should be of prepared hot dung, though this need not be so well prepared as for the formation of the bed, and may be fresher. The front of the bed should be lined first, following in about a week with the back and ends, and it will in most cases be sufficient if the linings have a base of 18 inches, and be gradually tapered off to meet the frame within a few inches of the lights. As the lining sinks litter should be placed on the top, so as to cover the sides of the frame, for from the thickness of soil on the bed the atmospheric heat derived from the bed will not be sufficient, therefore keep the sides of the frame always covered with litter, which will retain the heat of the linings, and keep the temperature from falling too low. Dais made in or after March will hardly need linings; but when the heat is declining, and the top heat, from the increased depth of soil, is apt to fall considerably at night and in cold days, litter should be placed against the sides and ends of the frame upon the ledge of bed formed by the frame being of less dimensions than the bed: and this upper or frame lining should be attended to in about fourteen or twenty-one days after the plants are put in, and afterwards be kept well banked up as it declines or wastes, keeping it to within 2 or 3 inches of the lights, so as to permit of their sliding up or down without interfering with the lining. This top lining will not be required after May.

PROTECTION.—For a few days after the bed has been made the heat will be sufficiently high, but there will be a gradual diminution of the temperature after the maximum of fermentation has been attained, and though the temperature for a

considerable time might be high enough were the weather to be uniform in temperature, cold nights will occur, during which the temperature of the frame will be so reduced as to jeopardise the plants' continued health and growth unless means be adopted to ward off the cold or retain the heat. Mats are the best material. One thickness will be sufficient for a time after the bed is formed, but when the heat declines two thicknesses or double mats are needful, especially in severe weather. In nights of very severe frost, and when the heat of the bed or linings is not strong, a covering of dry litter or hay in addition to the mats will be a great protection. The material employed, whatever it may be, should be so placed that it does not overhang the dung, particularly if the bed be fresh lined, and the heat from the dung at all rank. The protection should be large enough to turn down a few inches without lapping over on the dung. It may be secured to the frame, which is desirable, so that it may not be displaced in case of wind.

The covering may be placed over the lights at five o'clock in February, and need not be removed in the morning until eight o'clock; or in severe weather half an hour earlier in covering up or removing may be allowed, and will be found more beneficial to the plants than allowing them to be starved. In March the frame may be covered up at 5.30 p.m., or if the weather is frosty half an hour earlier, and the covering removed when the sun is beginning to have power, or at half-past seven o'clock in the morning, allowing half an hour or an hour later on very cold, frosty mornings, whilst in those which are fine the covering may be removed sooner. In April the covering may be put on at or before 6 p.m., and removed at 7 a.m., or 7.30 a.m., or later if cold, and in May the frame may be covered up at 6 p.m., and the covering removed by 7 a.m., or in case of frost not until the sun has power. If there is no frost, and the temperature is sufficiently high, the covering cannot be removed too soon. In no case ought it to remain after the sun has power to raise the temperature of the frame; but if its temperature be low, it is well to leave the covering until there is a prospect, from the increased warmth of the air, or from sun heat, of the temperature of the frame not falling after the protection is withdrawn.

—G. ABBEY.

OUT-OF-DOOR GRAPES.

My attention has been called to the interesting article on the above subject by "ARCHAMBAUD," in the *Journal* of December 3rd, which I had unaccountably overlooked, for I make it a rule to read everything that appears in *THE JOURNAL OF HORTICULTURE*.

The improvement of the cultivation of Grapes on open walls is a field especially open to the amateur and cottager, to whom, I fear, we must look for any advance in this branch of fruit-growing, for the professional gardener who has plenty of glass will always regard out-of-door Grapes with disdain. If such persevering men as those who have recently raised the fine seedling late varieties could be persuaded to turn their industry and skill to the raising of early sorts, a complete change might be effected in the open-air cultivation of the Vine.

In selecting the best from the sorts which we now possess, I agree with "ARCHAMBAUD" that the Royal Muscadine, or, as it is very commonly called, the White Sweetwater, is the best, at least the best white variety.

Though we agree about the best white Grape, I am very far from coinciding with "ARCHAMBAUD" in the wholesale condemnation of the Esperione (Espiran). This sort I consider the best hardy black Grape that can be planted out of doors, and with me is always good under glass; and it ought to be more planted in cool greenhouses and orchard houses on account of its hardiness and early productiveness. Of the two it is a better setter than the Royal Muscadine, although the latter cannot be found fault with on this point.

"ARCHAMBAUD" says that it was the late Mr. Beaton, who first gave the Esperione its false character, extolling it to the skies, not knowing at the time that the subject of all his praise was not the Esperione at all, but simply a fine example of the true Black Hamburgh. I am not in a position to say that the fine Grapes exhibited by Mr. Beaton, and which caused such a sensation at the time were examples of the Black Hamburgh or of the Esperione, not having seen them; but this I know, at the time alluded to, Mr. Beaton sent me three eyes from his Vine, to grow and compare the fruit with that which I was certain was the true Esperione, and they proved to be the same. Now, those who were acquainted with Donald Beaton know that he was not the man to exhibit fruit of one plant and send

cuttings of another to have their fruit compared to test their being true to name. There must be much confusion still existing about this Grape, but any one who desires to see a description of it will find it described to a nicety in Dr. Hogg's "Fruit Manual."

I am glad to see your able correspondent includes the White and Black Frontignan. In favourable seasons they do very well, and so does the Grizzly Frontignan. I have had this sort finer-flavoured out of doors than under glass. There are two other varieties concerning which I can speak favourably for the open wall. One is the Ciotat or Parsley-leaved; in bunch and berry it is a Royal Muscadine, but its cut leaves make it very different and very ornamental. The other is Bidwill's Seedling, a Vine not so generally known as many others. It is much grown in the neighbourhood of Exeter, where it succeeds well in the open air. Under glass I have invariably found it with a disagreeable earthy flavour which increases when the fruit gets over-ripe.

Were I capable of writing a volume on the cultivation of the Vine on the open wall, the pith of it all would be contained in the following short sentences.

Grow the wood one season and fruit it the next.

No snag-pruning. Prune early; cut out the wood that produced the fruit as the fruit is gathered.

Finish all winter pruning by the middle of December.

Nail or fasten the shoots the first week in March; before doing so paint them well with the following mixture:—Mix clay and water to the consistency of thin paint. To a quart of this add $\frac{1}{2}$ lb. of flowers of sulphur and 2 ozs. of glue. Use it as soon as mixed.

If the Vine show two or more bunches on the shoots that spring from the eyes that were left at the winter pruning, take all off but one, and stop the shoots at two or four leaves (as there is wall room) above the bunch.

Thin the berries out well, where there are three leave one; also thin out the small shoulders where they appear crowded, and do so before or when the berries attain the size of the seed of early Peas. It is in a great measure from want of this thinning of the berries that we see such rubbish of out-of-door Grapes.—A. McKELVIE, Torrington, Devon.

[Before Mr. Beaton's death we had an opportunity of examining the Vine he considered to be Espiran, and we found it to be Frankenthal, a conclusion which Mr. Beaton also readily admitted. There are, however, places in the southern parts of our coast, where, we are informed, the true Espiran is cultivated successfully out of doors.—EDS. J. OF H.]

GARDEN LABELS.

I ENCLOSE a specimen (damaged) of a label that I have adopted for fruit trees, Roses, &c. As you will see, it is absolutely indelible, being glazed over the writing. I buy the unglazed labels, write the names on them with a quill pen dipped in cobalt mixed with turpentine, and glaze them in a small furnace. Here let me say that I do not make them for sale, and have no interest, direct or indirect, in introducing them. Of course, the objection will be raised that everybody has not a furnace to glaze them in. This is very true, and my principal object in writing to you is the hope that some enterprising nurseryman may open up relations with some manufacturer of earthenware, so as to be able to supply the public with so great a desideratum. I do not hesitate to say, speaking as a man of business, that they could be supplied at 1d. each, and give a good profit both to manufacturer and retailer; and I think there must be many hundreds of growers of fruit and Rose trees who, like myself, would gladly pay that sum rather than be bothered with the present unsightly and easily-obliterated labels, whether of wood or zinc.

Another objection that has been raised is that new Roses, &c., are constantly coming in and going out, and that it would be difficult to supply names in cases where, perhaps, only one or two would be required; but I cannot see why the nurseryman who takes the order should not send a list every fortnight to the manufacturer, so as to give the latter, with the orders he would receive from other nurserymen, enough to make a batch for glazing. Or the customer might procure his own labels—I have bought them retail at 1s. 6d. a-gross unglazed—write the names himself, and send them to be glazed. There is no patent in the matter, and, indeed, as far as I know, nobody has ever made them but myself.

To turn to another subject. Has anybody tried growing fruit

trees as cordons trained over a walk on an iron rod bent to form an arch? and, if so, how has it answered? If not, why should it not answer, and be more ornamental than vertical cordons, besides covering only useless ground?—A. O. W.

[The label sent by our correspondent is of white porcelain, and in an unglazed state; other specimens may be seen attached to trees and shrubs in the conservatory entrances of the Royal Horticultural Society's garden at South Kensington. If they were written upon with a pointed style of lead—the metal, not a common lead pencil—we think that they would remain legible for years, might have the writing scraped off when needful, and be rewritten upon.]

THE CHRYSANTHEMUM.

At this dull season, when the beauty of the flower garden has passed away for a time, and Flora, alarmed by those frosts with which Winter proclaims his coming, is preparing to take her departure, she bestows upon us ere she goes one of the choicest of her gifts—the Chrysanthemum. That this most beautiful flower is now more thoroughly understood than formerly, the rapid progress made of late, and the many splendid varieties produced year by year, will testify.

I can fully endorse the statement of your correspondent "G. S.," which appeared in page 419, as to the benefit resulting from converting the orchard house into a winter garden. In my orchard house, a span-roofed structure, I cultivate other flowers as well as the Chrysanthemum—for example, Pimulas, Violets, Mignonette, Schizostylis coccinea, and Variegated Pelargoniums. The effect is exquisite, and excites the admiration of all on bright days, of which we have had but few of late. The fragrance arising from these flowers is delicious.

I do not intend making any observations on the older and proved varieties of Chrysanthemums, but on those sent out this year, which I feel certain will be decided acquisitions. The effect produced by Japanese Chrysanthemums mingled with the Large-flowering and the Pompon varieties, is all that could be wished. Their fantastic forms and brilliant colours are most novel and pleasing, many of their immense blooms having more the appearance of tassels formed of the gay plumage of tropical birds than that of flowers. I feel assured that they will become very popular on account of their merits alone.

*Wizard** is one of the most beautiful of the actinoid class; the flowers forming loose tassels of a bright reddish maroon colour. Of good habit, and a very free-blooming variety.

Red Dragon.—The flowers are very double and of very large size, composed of long subulate florets of the most novel and elegant form, red chestnut tipped with yellow. A very free-blooming variety.

Yeddo Lilac.—Rose lilac, and lighter centre. The florets take an upright position, thence arch inwardly, thus forming a complete ball.

The Tycoon.—Very bright red, with a golden orange back. The florets, which are very long, are curiously curled.

The Daimio.—Pale pink changing to rose lilac. Flowers large, double, of great substance, and very showy.

Tarantula.—A most singular flower, with a close button-like disk, and a single spreading ray of long, slender, tubular, golden florets.

Red Indian.—Flowers very large and double, red; flower flat. *Robert Fortune*.—Bright orange or amber. Large and full.

Roseum Album.—Rose-tinted, and spotted with white. The flowers are of moderate size, and are very valuable for bouquets and for the dinner table.

Sulphureum.—Sulphur white, sometimes spotted with rose. The flowers are large and double, and remain a long time in bloom. A free-growing variety.

Prince Satsuma.—Bright golden yellow, large and very double. The flowers have somewhat the appearance of a rosette.

Nagasaki Violet.—Dark rosy violet, and golden disk; the florets sometimes spotted with pure white. A most attractive and curious variety.

Aurantium.—Clear golden yellow, of immense size and very double. This splendid variety is particularly distinguished by the breadth and massiveness of its wax-like petals.

Comet.—Bright orange yellow, changing to chestnut red; florets very long, and curiously twisted and curled, giving to this flower the appearance of a large bunch of gold thread.

* For this and the succeeding descriptions our correspondent is mainly indebted to Mr. Salter's catalogue.

Leopard.—Bright red, with large yellow spots on the surface of the petals—a most novel combination of colour.

Most of the varieties named are showy, and present a very chaste appearance. I usually strike them in November. When struck I place them in a pit to harden off, and then shift them into blooming pots, generally into 8 and 12 sized pots. The compost employed is a strong fibrous loam, rotten dung, and leaf mould. Liquid manure is given very frequently. In this I put plenty of decayed cow droppings—in fact, to thrive well *Chrysanthemums* require plenty of dung. This morning there called on me a gardener who is a good grower of *Chrysanthemums*, and, whilst showing him through my winter garden, he remarked that to grow them well they should have plenty of rotten dung.

Before closing this paper I wish to say a word in favour of one of the Japanese *Chrysanthemums* in particular. I believe I shall not be far wrong when I say *The Daimio* is the most superb variety named, of extraordinary size and substance. *Mrs. Haliburton*, a large-flowering variety, is the most perfect white I ever saw. It is the gem of my collection. I usually plunge the pots in sifted ashes. Care ought to be taken not to allow worms to enter the pots. I place these so as to be exposed to the sun from early morning till late at night all through the summer. On the least sign of mildew being perceived, I instantly sprinkle the foliage well with sulphur and let it remain on all night. In the morning I give a good syringing. I apply to the plants a top-dressing of sheep's droppings, and have found it very beneficial. Under this treatment I invariably meet with success.—F. P. L.

ROSE SEED AND SEEDLINGS.

THE interesting notes on the ripening of Rose seed in England, by Mr. Curtis, are valuable as affording the means of comparing results between the present, past, and future seasons, and between the climate of Devonshire and that of other districts of the country in ripening seed of the different varieties of Roses. Most of those mentioned by Mr. Curtis have ripened seed with me this season, but the heps of Charles Lefebvre, which usually ripen here, have become prematurely withered before being properly coloured.

In addition to the varieties named by your correspondent, I have just gathered ripe heps from Lord Raglan, Madame Caillat, Anna de Diesbach, Madame Furtado, Madame Boutin, La Ville de St. Denis, Madame C. Joigneaux, Marie Baumann, Thorin, Antoine Ducher, Gloire de Santenay, Prince de Poeris, Prince Léon, Duc de Rohan, Beauty of Waltham, Madame C. Wood, Madame Damage, Camille Bernardin, Exposition de Brie, Abel Grand, Dr. Lindley, Comte de Nanteuil, François Louvat, Mons. Boneenne, Victor Verdier, François Lacharme, Madame Moreau, Comtesse de Paris, Le Rhone, and numerous other Perpetuals, and from Charles Lawson and Madame Zoutman amongst summer Roses.

I have found the past season one of the worst I remember for cross-fertilising the Rose, the excessive heat early in the summer having been more damaging to successful fertilisation than our ordinary amount of moisture in most seasons.

On John Hopper and Madame Knorr, two excellent varieties named by Mr. Curtis, I have never yet seen seed, although I have, during the past twelve years, cross-fertilised and recorded nearly a thousand blooms, including many of those varieties. Experience has, however, satisfied me that cross-fertilisation of the Rose is not so productive of the end sought as might be expected, in comparison with the results obtained from a similar treatment of many other flowers and plants. I have, however, been able to gain some valuable acquisitions amongst a vast amount of mediocrity and labour lost. In some seasons I have scarcely obtained a single ripe hep or seedling from upwards of a hundred attempts at artificial fertilisation. I would therefore recommend the tyre not to attempt cross-fertilisation of the Rose on a large scale, but to rely more upon the naturally fertilised produce of those kinds which do not easily seed, especially the light sorts, and certainly not to take much trouble about such varieties as Général Jacqueminot, Maréchal Vaillant, and other free-seeding reds.

Amongst the results of cross-fertilisation, I have obtained seedlings from Madame Vidot, Comtesse de Chabillant, La Ville de St. Denis, Anna de Diesbach, Louis Peyronny, Victor Verdier, Charles Lawson, and Gloire de Dijon, and from the latter I have some ripe heps of the offspring. Upon the whole I consider that the watchful English amateur may, with work

and patience, in this field, especially if favoured with a dry soil and climate, achieve an ample reward for his pleasurable toils.

I should add that the soil here, overlying the oolitic limestone, is dry, and suitable for the ripening and flavouring of fruits generally, although, from the prevalent east winds, the springs are excessively cold and unfavourable to the setting of early blossoms, which are frequently injured in the bud and abortive. The climate is more devoid of humidity than the central, northern, southern, and western districts.

To those who have not attempted the raising of seedling Roses, but contemplate doing so, I would recommend a perusal of the chapters on "Hybridising," and "Seedlings," in "*The Rose Garden*," by Mr. William Paul, a work containing eminently practical teachings; and if the instructions contained therein be followed, I feel sure much disappointment may be saved and considerable success secured; and although we may still have to go to southern climes for most of the new varieties of Teas and Noisettes, there can be no reason why, in some parts of this country, advances should not be obtained upon John Hopper and Beauty of Waltham, and Roses of that class, and even upon the more illustrious *Devoniensis*. One of the first steps towards securing these ends is for growers and amateurs, especially the latter, whose province, Mr. Paul justly says, it is to raise seedlings, mutually to give and receive information upon the subject. I trust, therefore, I may hear through your columns of the experiences of other labourers in the same vineyard.—THOMAS LAXTON, *Stamford*.

THE CLAIMS OF WINTER ORNAMENTAL GARDENING.

(Continued from page 478.)

BEFORE describing the mode of planting, it may be as well here to take a glance at the materials that have hitherto been sufficient for the purpose, but to which I intend making additions when advisable. First of all, I will state that the ground on which I have principally carried out the winter decoration, is laid out in two borders, each 18 feet wide, and a large oval bed measuring 90 feet by 67½. A 3 feet margin of turf reduces the latter bed by that much all round, still it presents a large extent of ground, and we have generally had a centre compartment 16 or 18 feet in diameter planted, and smaller ones as well, with a groundwork of coloured material, and that groundwork intersected with some other fancy work of similar material, with a suitable bordering.

The plants we use are in themselves simple enough, and easily obtained and grown. A few tall upright-growing plants 4 or 5 feet high seem indispensable, and they ought to be such as will readily bear removing in the autumn. Irish Yews and *Cupressus Lawsoniana* are about the best that I have used, but it is very likely Swedish Juniper, and many other plants of similar habit would answer as well, but I was not so successful with Virginian Cedar, though *Arbor Vita* did very well. These tall plants occupy the centres of groups, which may consist of any description of evergreen which can be removed without showing the effects of the operation. I have found *Aucubas* and *Box* about the most effective, as well as the most compact and neat-looking plants, but *Laurustinus* has done well in mild winters.

Assuming that the foregoing plants or those of a kindred character are planted round the central Irish Yews, or other conspicuous plants, it is better to surround them by a line of white-leaved plants, if such can be had. Here we have found the old *Lavender Cotton*, when forming stiff, tufty plants, almost as good as anything, and it transplants well. Much better still, only the plant is so low-growing, are good large tufts of *Arabis albidia variegata*. The beautiful cream-coloured leaf which this plant has in winter renders it by far the most important winter decorative plant I know. It must be borne in mind, that the ground is damp on the surface the whole time, or nearly so, that winter gardening is required, and white-leaved plants are seen to much advantage then. The *Arabis* also transplants well, and 20° or 30° of frost do not seem to have any effect upon it. It is often necessary to plant edgings of this or other plants at the present time, and slips 6 or more inches long, taken from old straggling plants, have only to be buried in the earth up to their neck, and they invariably grow, and in spring are found to be well-rooted plants, that may be used anywhere. So large a proportion of the leaf being white, gives the plant a pre-eminence over all others I

have yet tried. I am, however, in hopes that *Barbarea vulgaris* variegata, recommended by your able correspondent, "AVONSHIRE GARDENER," and of which he has kindly sent me specimens, will form an excellent companion to the *Arabis*.

A much less effective plant is *Stachys lanata*, as its foliage becomes somewhat grey and dirty-looking, only when a sufficient number of the *Arabis* and other plants cannot be had, it may be worked in. *Cineraria maritima* I have found transplants badly, and is injured and disfigured by frost, if not killed, and the same may be said of *Centaurea gymnocarpa*. A white-leaved *Ajuga* which I have tried, is bad in habit, and I have never been able to have the ornamental *Kales* in condition before the time it was necessary to take them up, so that I have abandoned them as winter ornaments, however beautiful they may be early in spring. My object is to have all perfect by the end of November, but these varieties of *Kale* rarely show more than a sort of embryo colouring at that time.

As the site of the bed and borders which are winter-decorated is exposed to high winds, the plants named in the preceding paragraph often suffer more than might be expected, and dead or partially decayed leaves following after high winds, we have not used them much. Perfectly hardy plants with ornamental foliage not being numerous, I have for some years been on the look-out for such, and after repeated trials and disappointments I have found the best for appearance under all vicissitudes of weather to be the very old and much-neglected *Helleborus foetidus* (Bear's Foot); its Fern-like foliage spreading evenly all round the stem, contrasts by its dark green hue very strongly with the paler and more delicate tint of the inflorescence, which appears in defiance of all weather during the dark days of winter. This plant also transplants well, and in summer is not particular as to site. I have, therefore, every confidence in recommending it as one of the very best of its size for winter use. It may be had from 1 foot to 18 inches high, as even small plants look well, but I prefer those approaching the flowering condition. In addition to this I have sometimes used a broad-leaved Saxifrage—I believe *S. calandulacea*—but its leaves are liable to be battered by the wind; and the pretty foliage of *Pulmonaria officinalis*, rivaling that of many hothouse *Begonias* early in autumn, seems unable to hold its own against the same influence. *Sedum glaucum*, *Sempervivum californicum*, and others of their class look well when near the observer, but are scarcely visible at a distance of 50 or 60 yards; but they are admirable for vases with a plant of the *Hellebore* alluded to for the centre, where it braves the winds without sustaining any damage. Patches of Ribbon Grass when it has been out down late in summer and formed a fresh growth come in very well, and I have more than once made use of a plant that baffled experienced flower gardeners, who, after admiring its outline, could not well withdraw their commendations when informed that it was the common *Sedge* from the sides of ditches and ponds. Good plants of this look remarkably well, but some care ought to be taken not to have those with too long slender leaves; but stubby, short-foliated plants from an exposed place do well, and form no bad substitutes for *Arundo conspicua*, or *Pampas Grass*—besides, they have the recommendation of costing nothing. The wild and other *Primroses* I have also used at times, but they present but little to recommend them in November; nevertheless, a place may be assigned them. The single white *Alyssum saxatile*, although beautiful as a spring flower, is too late for my purpose; but *Crocuses* are often planted, and *Snowdrops* are better still, as they are less interfered with by mice.

Some other plants have at times been tried. A friend of mine uses plants of wild *Heath* from a neighbouring common that have been nibbled into shape by rabbits; and now and then *Wallflowers* and other neat-looking plants are worked in, but I am no advocate for great variety, and the best results which I have yet seen have been accomplished by the plants at present employed. Although I have mentioned many names, the number of different plants used on each occasion has always been small. In my case, however, perhaps the most important one of all remains yet to be mentioned, and that is plain turf, which has always been more effective than any other.

It may here be remarked, that although variegated *Hollies* of both the Silver and Golden sections would be a great addition, I have omitted them in consequence of their being difficult to obtain in quantity, and because they do not bear transplanting so well as some of the other plants. To those, however, who do not mind expense these shrubs would, no doubt, be an acquisition; probably, also, neat plants of common *Yew*, *Thuja*

aurea, and others. My plan, however, has been to make the greatest display I can with the commonest plants.

As colouring materials are an important feature in the arrangements, I may state that these, too, are the simplest and least costly that can be had. We only use three colours—red, white, and black; the last is produced by sifted cinder ashes; a good white sand found in the neighbourhood gives the white; while a cartload or two of waste kiln bricks not sufficiently burnt to be of any use for building, serve when broken up to make a bright and telling red. The beds or groups of plants are often surrounded by an edging of turf 6 inches wide, or if it is a large group a wider band is made use of, while the figures denoting the embroidery or fancywork in colours are marked out by lines of broken stones of uniform size and hue, picked out of a heap ready for road-making or mending. Pebbles would, perhaps, be better, but these are not plentiful here, and the stones answer. With these a tolerable representation of a sprig of foliage may be formed, which, being coloured differently from the ground, may be made to look well; but too much intricacy is not advisable, as confusion in plan is much to be deprecated. I well remember when the Royal Horticultural Society's garden at Chiswick was first laid out, there were four compartments in the polychrome style, representing the four plants emblematic of the countries composing the United Kingdom, but it required more discrimination than most people possessed to ascertain with certainty which was the Thistle and which the Leek. Puzzles of design in this way may be admissible and admired by some, but I have no taste for them. I would rather see a simple design carried out clearly than have to guess at a complex one, or what is more likely still, to have to hear it explained by some one in the secret of its conformation; and as a very simple figure repeated becomes one of beauty, it is better to be content with that than attempt too much in the way of enrichment.

Having said that we only use three colours, I may yet further add that some of our best designs have been accomplished with only two, white being always one. Some years ago a bordering to our large bed, which I think was upwards of 8 feet wide, was done in two colours only, and with great effect; it was simply that kind of bordering we often meet with on china-ware or other objects, and called "the Greek pattern." The limbs or lines of this figure were about 10 inches wide, and it was simply black and white, the bead-like lines of stones adding much to the general effect. I do not think I have ever excelled that pattern as a bordering, although I have tried various kinds of what is usually described as fringework. The groundwork of the main portion of the bed where the groups of plants, with their turf margin, stand wide enough apart to allow it, may be further embellished by some bold lines of scrollwork thrown in amongst them, with now and then, perhaps, a small circle of turf, or a collection of smaller plants in a group, edged either with the stones alluded to, or it may be the variegated *Arabis*. Description of this kind of work is difficult without recourse to a plan, which also only imperfectly conveys an idea of what is aimed at, and it is not easy without the inspection of an example to conceive the effect produced. It is only after repeated trials that the objections from which no design is exempt, are rendered fewer and of less importance. Enough, however, has probably been said to enable the reader to comprehend what is really meant. As few flower beds are, perhaps, so large as those here operated on every year, it may not be in the power of everyone to produce the same result, but some modification of it may be attempted in most places. I shall be well repaid if I succeed in inducing anyone to whom the winter's appearance of his flower beds is of more consequence than the spring display, to abandon the latter; and by taking advantage of the four winter months, which do not in the least infringe on the summer display, he may have the whole removed by the middle of March, and the beds undergoing the necessary working for the summer floral crop, for which the two months at his disposal give ample opportunities. Winter gardening, therefore, in my opinion is of much more importance than spring gardening, and I expect to see it still more practised than it has hitherto been, when the number of light-coloured-foliated plants available for the purpose shall have been further increased, for I consider plants with foliage of that description, contrasting as they do with the damp earth, indispensable to effect.

Having said so much in favour of a winter display, I by no means wish to imply that some attempt at spring gardening should not also be made, but I would advise a distinct set of beds for this purpose—say those of a promiscuous class, which

most gardeners possess examples of, leaving the principal parterre, if there should be one in a conspicuous place, to be occupied by the plants and other things recommended for winter embellishment. Some early-flowering annuals as well as bulbs and perennials, are deserving everything that has been said in their favour, and although we arrange some of our beds for winter as described, others are planted with Forget-me-not, Saponaria, Silene pendula, Wallflower, Alyssum saxatile, and other plants; but those latter are in a less conspicuous place, and where a good display of bedding plants is not looked for by the middle of June. Although the season up to the time I write (the middle of December) has been exceedingly mild, these plants present but little that is interesting to look at, while those in the winter beds, with their accessories, are all that can be desired. Let, therefore, both plans be tried, and tried fairly, and excepting in the cases where an April and May display is of more consequence than one in June and July, the winter decoration of the flower garden will commend itself in preference to that in spring; and the materials, as I have shown, are neither expensive nor difficult to be obtained.

Although, like most others, I object to the eye continually resting on polychrome figures alone, yet when a pleasing design of these and foliage together can be arranged, there are few who will not admire it, especially as it is only intended for the dull months of the year; besides, each year gives scope for a fresh design, which of itself is no small incentive, and its comparison with that of former years supplies matter for remark. It is scarcely necessary to observe, that the number of different designs which may be so carried out is infinite, added to which the very often-all-important summer planting is not in the least interfered with; on the contrary, I am not certain but the ground is in a better condition if left somewhat firm all winter than if loose and fresh dug, and as it is recommended to trench it in the autumn, ordinary digging in the spring is all that is necessary. We always dig in what sand and broken brick may have been on the ground, and even a portion of the cinder ashes is left on, but we usually take the most of them off.

The soft red brick used for colouring is broken so as to pass through an inch sieve or screen; it is well not to pound it too much into dust. Two or three boys will speedily break up all that is wanted, as we do not lay it and the other colouring matter on more than an inch thick, after having first smoothed the ground as well as can be done with the back of the spade or shovel. In marking out figures a pointed stick is all that is wanted, with, of course, the measuring rod to determine the true position; practice, however, enables one to do this more rapidly than might be expected, and as fine dry days are not over-plentiful in November when this work has often to be performed, the most must be made of those that do offer themselves. A transformation from a mass of Pelargoniums and other plants, hopelessly destroyed by frost, to a pretty device worked out as described, is the more relished, perhaps, when it has been accomplished during the few days' absence of those for whose pleasure it has been made.

I hope that some one who has successfully practised winter decorative gardening in a different manner from that which has been here described, will be so good as to give an account of his practice. There is much to learn, at the same time do not let us confound winter with spring gardening; the latter has had its advocates plentifully enough, while the former, though embracing a longer space of time, has never yet had full justice. Let us hope the time has come when it can be practised as advantageously as other kinds of gardening, and let those whose winter sojourn in the country is gladdened by no floral display, have no cause to complain that objects of natural or artificial beauty are so scarce as at present. It may be the case that some plant or material available for winter decoration may have never yet been thought of; let, therefore, all interested in such matters turn their attention to the subject, and the Antipodes will have to yield their treasures ere we be satisfied.—J. RORSON.

THE WINTER.

MILD as it is here, yet at St. Petersburg the cold is as intense as usual; and the following is an extract from a letter we have just received from Canada. It is dated Dec. 12th:—"There is every indication of a very severe winter setting in here. The snow has lain on the ground for two weeks already,

and the mercury goes down to about 15° Fahr. every night, and has been once down to 5°, and in Toronto to 2° below zero. This is unusually severe for this time of year. In the back settlements, bears and wolves are very numerous, having come into the inhabited districts in search of food.—W. T. G."

A TREE-PROTECTOR.

HERE you have a tree-protector that will ward off the rabbits; One may be made of strips of lath tied together with annealed wire. It can be made of any size or length desired, according to size and height of tree. You simply wind it round the tree, and fasten with the wire or a tarred string. It may be made

large enough for any tree, and then can be used on small ones by wrapping it further round. When not wanted it will straighten out and pack away in small compass. It is simple, any boy can make it. It is cheap and effective, and properly cared for will last a lifetime.—L. L. F. (in *Prairie Farmer*.)

CULTURE OF ASPLENIUM TRICHOMANES, AND A FEW OTHER FERNS.

SEEING at page 437 of the Journal, that "G. H. T." says *Asplenium trichomanes* is "very unwilling to be domesticated," I beg to state for those who may wish to grow that most beautiful and interesting evergreen Fern, that of all the British Ferns that I have cultivated, I find this the most accommodating. I have had beautiful plants from 8 to 10 inches high, grown in peat and leaf mould in pots in the greenhouse, and have them now in the fernery out of doors, beautiful dark green tufts, with fronds 9 or 10 inches long, and looking at this season better than any other Fern there. I have *Ceterach officinarum* with fronds 6 or 7 inches long, and *Asplenium adiantum-nigrum*, with fronds 10 or 11 inches long. All these may be seen by hundreds on watts in Gloucestershire, but I have never seen them so fine as those artificially cultivated. I have also seen *Asplenium lanceolatum* growing abundantly at a place about 4 miles from Bristol, fortunately where the public have not access. I have also *Asplenium viride*, very fine, fronds 7 or 8 inches long; *Polystichum lonchitis*, with fronds from 14 to 15 inches long; and *Asplenium marinum*, with fronds from 9 to 10 inches long.

All those I have mentioned are planted out in artificial rockwork, in a mixture of loam, leaf mould, and peat, with a little silver sand. The aspect is north, and sheltered from the wind. I should like to know the reason why no Ferns are found growing wild in this neighbourhood, yet they appear to do well when planted.

There are two Ferns I cannot do anything with—namely, *Asplenium septentrionale*, and *Allosorus crispus*. I have had several in-doors and out, which live for about one season, and then die. If any of your correspondents have grown them successfully, I should be very much obliged for the treatment they give them.—JOHN BRYAN, *Audley End Gardens*.

Your correspondent "G. H. T." speaks of *Asplenium adiantum-nigrum* as "never found, I fancy, in great abundance." It is most abundant in this neighbourhood, but not easy to grow in the hardy fernery. I think the reason is, that

liking a light soil, when removed it does not readily recover itself. I planted a hardy fernery some three years back, and filled the crevices of the stones with this Fern, and have now some good specimens.

The same rule applies to *Asplenium trichomanes*, which your correspondent states "is very unwilling to be domesticated." I own, I lost many plants at first, but now I have plenty of good plants, even more than I require.

It may, perhaps, interest some of your readers to know that *Woodwardia radicans*, *Polystichum setosum*, *Lastrea opaca*, *Lastrea decurrens*, *Cyrtomium falcatum*, and *Adiantum pedatum*, do well here out of doors, and with the exception of the last have with me stood three winters. By this I mean that they are really quite as hardy, and as vigorous in growth, and are now (December 12th) looking as well as our ordinary English Ferns. The same may be said of the American *Osmundaceae*.—H. A. Box, *Parker's Well, Exeter*.

MUSHROOM CULTURE.

As your correspondent, "FAILURE" (see page 466), wishes to know what is the kind of structure in which my Mushroom beds are made, I will state for his information that it is a small house which I have lately put up on the Oldaker system. It is 15 feet long and 9 feet wide (inside measure); there are six beds in it, three on each side, 3 feet wide, with a path 3 feet wide in the centre, underneath which runs the flue, which passes up one side the whole length of the house, and returns in a parallel direction down the other. The floor beds are sunk beneath the level of the ground about 1 foot, so that the tops of the beds are level with the path. The other beds are 2 feet apart and 9 inches deep. A floor or ceiling is then formed with boards 1½ inch thick, resting on the two wall plates, and on the standards which support the front of the beds in the centre; the whole is then covered over with 2 inches of sand. Square holes, 9 inches in diameter, are left in the ceiling, along the middle of the house, at 3 feet apart, and they are provided with slides to ventilate when needed. The whole is then covered in with a hipped-tiled roof. Square holes are left in the back wall (which is 18 inches higher than the front), at 3 feet apart; each of these is also fitted with a slide board, which admits air into the space left between the ceiling and the roof.

I use half a bushel of spawn to two of these beds; this I find quite sufficient.—AGRICULTURIST.

CINERARIA LEAVES CURLING—TRAPPING MICE.

I saw in your number for December 17th an answer to a correspondent who complained of his *Cineraria* leaves curling, and I have experienced the same evil in the case of my own *Cinerarias*, which I lately removed from a frame to the greenhouse, where the air is kept very much drier than in the frame. I was quite at a loss for a long time as to what was the cause, for no insect was to be seen; but I replaced in the frame one of the plants that looked worse, and I soon found it recover. I then determined to give those in the greenhouse a slight syringing every morning, and they have quite recovered. Perhaps similar treatment will cure "A CONSTANT READER'S" plants.

I observe frequent inquiries as to the best way of catching mice, and many methods of doing so have been pointed out. I have seen and tried numbers of these with some success. As the mice began last week to make great havoc among our *Crocuses*, I told one of my men to set some traps, and to strew coal ashes over the bed. The traps, which are of a kind quite new to me, proved very effective, and are so simple that they can be made in five minutes, even by a boy. It may, therefore, be of service to the readers of the Journal to describe them, as I know how destructive mice are to bulbs at this season, and to Peas, Beans, &c., in spring.

In the first place take a No. 1 flower pot, stop up the drainage hole with clay or a cork, then fill the pot with water to within 4 inches of the rim, make a hole in the ground near the bulbs or other plants which it is desired to protect, and sink the pot to within 3 inches of the rim. Plant two forked sticks, one on each side of the pot, the forks to be of just the same height above the surface as the rim of the pot; take a stick, such as you tie up plants with, about 2 feet long, round and small at each end, and square in the middle; cut likewise

two small pieces, about 6 inches long, with pointed ends; split the long stick in the middle, and insert the two small ones in it, so as to form a cross like the toy windmills which children run about with, only for the mouse trap the cross part is in the middle. Instead of paper, as in the toy, a Bean or a piece of *Crocus* is placed on each point, and the mouse travelling along the long stick to the top of the cross stick where the bait is, his weight turns the spindle round, he falls into the water, and the next point comes up to take its place. In this way scores of mice may be caught in a single night. We caught four in one night last week, and one of my men tells me he caught as many as twelve in one night last Pea-sowing time.—JOHN TAYLOR, JUN.

SANDRINGHAM WHITE CELERY.

I was induced this spring, from seeing an advertisement of a well-known firm, to purchase a packet of the Celery seed they were sending out as the Sandringham White. During the autumn, I mentioned to a neighbour who had called with me, that I had my suspicion that it was an old friend under a new name. "Oh," replied he, "the seedsmen did not send it out as a new one, only as a sort the Prince of Wales was fond of." A few days afterwards I visited Mr. Welch, Armagh, and seeing some very fine Celery growing there, I was led to speak of the Sandringham White. Judge my surprise when told that the seedsmen had laboured hard to convince Mr. Welch that it was distinct from the well-known variety, Turner's Incomparable, and as a convincing proof, sent a packet of each. They were growing side by side. Now, had a little seed of all the known and unknown varieties of white kinds been shaken on the counter, swept up, and sent out for Turner's Incomparable, the mixture could not have been more complete. I do not like to meet old friends under new names in this way. How much better to have sent it out under its own name as a selected stock of Turner's Incomparable. I had for some years given over growing the above sort, for the very reason of its being so mixed. Nor is it equal for table use to some of the others now in cultivation, such, for instance, as Williams's Matchless. There may be larger-growing sorts, but for quality it has few equals.

I find that it is the fate of a great many of our vegetable seeds to get mixed and spurious, and when grown it would puzzle anyone to say what kind they are, although when making out our seed lists, we choose such as are represented as "true" "very fine selected stock," &c. Now, whether we ought to blame the grower of seed, or the seller, either wholesale or by retail, I will not venture an opinion. One thing I know, the gardener is always the sufferer, and that often when too late to be remedied. Are there not enough of disappointments fall to our lot without old varieties being sent out under new names?—NORTH OF IRELAND GARDENER.

MILDNESS OF THE SEASON.

I HAVE regarded the late mild weather as very favourable to the ripening of wood buds and the perfection of fruit buds, with which most trees are well supplied; but on looking round to-day (December 19th), the thermometer reading 59° in the shade, I perceive vegetation is in some instances acting upon the old but wise maxim of "early to rest and early to rise," for Lilacs, Rhododendrons, Honeysuckles, Roses, and Gooseberries are showing unmistakable signs of starting. Mignonette is flowering freely, and some *Trentham* Rose *Pelargoniums* and Purple King *Verbenas* that were left out of doors are flowering tolerably well; but unless we have a winter as exceptional for warmth as the summer has been, the above-quoted maxim will not apply to vegetation with such truth as it does to ourselves, and unless more reasonable weather soon occur, we gardeners must make ample preparation against injury from spring frosts.—THOMAS RECORD, *Hawthorst*.

WORK FOR THE WEEK.

KITCHEN GARDEN.

As the weather still continues much the same the operations recommended during the last few weeks should be proceeded with. Everything used for the protection of tender plants should be in readiness in case severe frost should suddenly set in. *Cauliflowers*, if the autumn sowing failed it will be advisable to sow in a box, which may be placed in a forcing-

house, and when the plants are of sufficient size prick them out in a frame on a slight hotbed. *Celery*, the trenches should now be dug out, so that they may receive the benefit of the frost. In the spring Cauliflowers may be planted in them, or dwarf Peas or Lettuce between, which crops will be off by the time the trenches are wanted. *Potatoes*, if young ones are required very early, some of the Early Frame or any of its varieties may be planted on a slight hotbed; if it is not convenient to plant them immediately, they may be placed in a forcing house till they begin to shoot. *Radishes* may now be sown on a slight hotbed. Dung should be prepared for forcing vegetables which are required early; a considerable quantity of leaves may be used with it. In conclusion I would say to gardeners, as a general maxim, Take the advice of a celebrated nurseryman and "Sow thickly and keep friends with the cook," but attain that object by sending in an abundant supply, and by rendering it imperative on the man who serves the house to keep a regular account of all the garden produce.

FRUIT GARDEN.

Orchard trees of large size are often much neglected as to pruning, the heads being allowed to become so thick of wood that fruit cannot be expected except from the points of the outside shoots, and, except when the crop becomes accidentally thinned to something considerably below an average, the fruit is small and indifferent in quality. Dry frosty weather offers a favourable opportunity for properly thinning the trees, as men can work at this with comfort when it would be too cold for nailing, and advantage should be taken of the first spare time to give a careful pruning. The heads should be liberally thinned, cutting out all branches that cross the others, and dead pieces, leaving the shoots sufficiently far apart that light and air may have free access among those left when the foliage is on. In removing large branches care should be used to make close clean cuts, and if the wood be coated with strong thick paint this will help to prevent its decaying before the wound be healed over. Let all kinds of fruit bushes be pruned.

FLOWER GARDEN.

Every advantage of the present favourable weather should be taken for transplanting shrubs, trees, &c., so that all the principal and choice plants in this department may have sufficient scope to develop their natural characters. There are few situations in a garden more interesting than a well-regulated and well-arranged shrubbery, where every plant from the largest to the smallest has had room sufficient to form perfect specimens. Collections of shrubbery plants appear to be much less attended to than their true merits entitle them to. In planting a shrubbery the object is either to form shady walks among fine trees, to hide unsightly views, or to form screens or shelter against strong winds. Suppose the principal object to be a love of trees and a desire to possess large and perfect specimens, then it must be wrong to permit them to become so crowded as to destroy their forms; and it is contrary to nature to dig the ground among them, because in nature we never find them so situated, and though every pleasure ground ought to be avowed a work of art, the trees should not have the appearance of having been placed there by art, as they must have if surrounded by dug ground, but, on the contrary, we wish to make them specimens of nature in a refined and highly-cultivated state. A Persian Lilac, a Ribes, or Rhododendron, if properly planted and managed, will form a bush from 8 to 10 feet high and the same in diameter, in a period of from six to ten years. But where do we meet with such plants? Not in crowded and dug shrubberies, but where the great essentials to vegetable existence—light, heat, air, and water can play their proper parts.

GREENHOUSE AND CONSERVATORY.

A free admission of air to the greenhouse at all times if the weather is favourable will be advantageous, at the same time care should be taken to prevent as much as possible strong currents of dry wind from passing through the house, for they invariably prove extremely injurious to vegetation. A few of the earliest, strongest *Calceolarias*, *Cinerarias*, and *Pelargoniums* adapted for forcing may now have their final shift, using either 6 or 8-inch pots, according to the size of the plants. After potting let the shoots of the *Pelargoniums* be carefully pegged down as near to the rim of the pot as possible without breaking, they will require to be sparingly watered for a time, and placed as near the glass as possible. The general collection of *Pelargoniums* should now be stopped back for the last time, unless required to flower very late in the season. A liberal supply of water will be requisite for *Camellias* now swelling their flower buds. When they are planted out in the open

border in the conservatory, they should be carefully examined for fear of any deficiency of moisture at the roots. Should any signs of over-dryness be apparent, let the soil be forked up as deeply as the situation of the roots will allow, and give them a good soaking of soft or rain water. Two or three such applications at short intervals will do no harm, provided the flower buds are fast swelling, more than ordinary dryness is perceptible, and the drainage of the border such as it ought to be. The same kind of treatment may be advantageously applied to many plants under similar circumstances. Keep the supply of flowers as abundant as means will permit, and attend strictly and carefully to a judicious arrangement of colours. To keep a house well furnished with handsome plants in bloom at this season, and everything about it in perfect order, is an impossibility when there is not sufficient accommodation for growing plants with which to furnish it; and when this is the case it will generally be found good policy to secure a tolerable display for the winter season, if at the expense of keeping the house somewhat bare when flowers are plentiful out of doors, and if plants in flower are scarce their effect will be greatly enhanced by proper arrangement and strict attention to order and cleanliness.

PITS AND FRAMES.

The bedding plants must have attention, for in all likelihood many things are suffering from damp, and such plants as appear to be most affected should be removed to other quarters where a drier temperature is maintained. Keep the stock in pits and frames well ventilated, and the surface soil of the pots frequently stirred. Dust with sulphur *Verbenas* and similar plants attacked with mildew.—W. KEANE.

DOINGS OF THE LAST WEEK.

THESE have been much modified, owing to the Christmas week and the character of the weather. Provided receptacles large enough had been obtained, there need have scarcely been a place in the country but could have laid up a reserve of water to last through the hottest and warmest summer. After such a saturation of the ground, it is not likely that we shall feel the effects of a dry summer so much as we did the last.

KITCHEN GARDEN.

In this department very little could be done, and the soil having been beaten firm by the rains, the first opportunity of fine dry days must be taken to stir the surface soil, among all young crops especially. We have much *wheeling manure*, &c., still to do, but we do not like to commence it in such weather, as when other work can be done it is always bad policy in doing work to make work, which wheeling to any extent must do at present. In such work as making hotbeds, adding to the bottom heat in forcing pits, &c., much of this making work may be avoided by using planks for wheeling on, and what is often a simpler and more generally practicable mode, spreading a thin layer of long litter, say a yard wide, on the path on which there is much wheeling. When the work is done, this will only form a part of the sweeping up, and will leave behind the sweeping a clean unbroken path. Wheeling so as to break up paths into deep ruts and slimy mire, almost burying the wheels of the barrows, is such a waste of labour, and that of an unpleasant kind, and in general makes so much work afterwards, that the practice can only be justified in cases of peculiar emergency. The maxim is not half so much attended to as it ought to be, "Do not make work in doing work." The man who keeps this before him as a principle of action will go through much more work than one who does not, and with much more ease and comfort to all concerned. We have seen work done under unsuitable circumstances, when, without taking into account the great additional strain on muscle and sinew, even on the score of the extra work thus rendered unavailable, it would have been truer economy to have kept the men in the dry doing nothing, and we have never met with a garden, however small, where there was the slightest necessity for remaining a minute idle under cover. When work is thus timed men will not be seen nailing trees against a north wall with the snow and hail blinding them, and then in a few days cleaning and working under glass, with the sun bright and clear enough to scorch them.

FRUIT GARDEN.

The chief object now is to have all planting finished as soon as possible, pruning and nailing and tying proceeded with, and birds watched and frightened where they are troublesome, as a few hours of their nibbling will make wrecks of the finest-looking fruit trees. More especially shall we require to be

watchful, if a severe frost should succeed this very mild weather, which resembles the end of April more than the end of December. For bad weather, *cleaning glass and woodwork* of houses and frames, is suitable work. In washing, we have no objection to just a little soap in the water, so as to make the latter slightly soapy—say 1 oz. of soft or yellow soap in two gallons of water; but we are very shy of using it stronger, as then there is a danger of taking the paint away with the filth. In all particular cases, however, we rely more on warm water—say from 130° or so, than upon its having anything in it. We frequently throw it on glass and woodwork warmer than that, and then use water at or near the common temperature of the air for washing. The dash of warm water is one of the best modes of destroying the eggs of insects, though some of these eggs when quite dormant will stand a fair scalding with impunity. There is hardly anything more depressing than sitting in a room and looking at a window encrusted with dirt, and spider webs clustered in the corners, and could plants speak, they would tell us that nothing grieved them more than observing glass over them in winter so green and greasy that only a few of the weak rays of light could reach them.

We would direct the attention of "A SUBSCRIBER" to the above, who in washing his sashes has taken the paint off like the peeling of an Onion. We have no doubt, first, that the paint had been rather new, and, secondly, that an extra dose of soap, or, perhaps, soda or potash added, had been mixed with the water. It is safest to use plain water, and a little more exertion instead.

ORNAMENTAL DEPARTMENT.

The cleaning of glass and the fresh arranging of plant houses have here been prominent matters of work and of consideration. On the principle already adverted to, we have huge mounds of turf laid up for fresh pieces of lawn, because the ground was too wet to be levelled and the turf to be laid, and we could not take the turf to the place without tearing up the lawn ground, and thus making more work. When the weather changes we can move the turf by something lighter than two-horse carts. The ground that was fairly levelled we could manage to turf with the assistance of planks and boards, but the unlevelled ground was too wet for working at all profitably. Pruning and transplanting could be done; and as there are some large trees to be transplanted, that can be well done where the ground is firm and less dressed than a lawn. It is as late as we wish for removing large trees, but the ground is still warm, and as we cannot at present proceed with some particular groundwork, we will most likely do some of this transplanting that otherwise should have been left to a subsequent autumn.

Changing Flower Gardens, &c.—Some of our new subscribers are in doubts as to some hints thrown out in this respect. Well, then, in the smallest places changes are pleasant, even if everybody should not consider them improvements. There are few that have the inventive genius and such a ready use of the pencil as our friend Mr. Robson; but there can be no doubt that one of the great charms of the chief flower garden—the huge bed of flowers at Linton, is not so much its fine position as the simple fact that every winter and every summer there is a fresh plan and fresh arrangement to look at. Monotony is thus altogether prevented. It is true that the arrangement, especially in summer, would tell for but little if the practical details were not well carried out; but supposing that the carrying out of the details were as perfect year after year at it would be possible to make them, who is there that does not feel that the thorough change in form and arrangement of itself constitutes a charm? Now, in the smallest places—whatever be the plan or the arrangement of the smallest flower gardens, it is always easy to change the form and the position of the beds, and, as already stated, even if the change should not to the arbiters of taste be an improvement, still the change will be pleasing to those who make it. But for always having more work than we can well perform, we would be one of Mr. Robson's foremost disciples in thus changing the appearance of the flower garden. What we have been chiefly obliged to content ourselves with is to change the cropping every year, but this, of course, leaves all the outlines the same, and therefore these very outlines become monotonous.

We find that the changing of the flowers becomes as necessary to us as the rotation of cropping is in the kitchen garden. We thus to a great extent avoid the necessity of procuring fresh soil for the flower beds, and this suits a great many of our readers who can manage to form a flower garden at once, but who could not well bear the expense of the frequent renewals of soil for the flower beds. Now, as in our case, we feel that

the time may come when, after deep stirring, adding even a little of the subsoil and a little manure, still the soil may require a rest from flower-growing, and in such a case, supposing the flower garden to be on a lawn, what more simple plan could be used than a new design, in which as much as possible of the old flower beds should be turfed down into lawn, and the lawn part turned into flower beds, giving thus fresh soil for a fresh flower garden in much the same position? Even by doing this gradually, fresh soil could be frequently obtained without the trouble of collecting and carting.

Arrangement of a Small Greenhouse.—In answer to an "OLD SUPPORTER," we would follow up the same principle in every plant house, however small. Hence for all small places the greenhouse, with most of the plants moveable, is superior for the interest it yields to a house with all the plants fixed or planted out. The latter, looked at daily, becomes monotonous, and the finest objects thus become wearisome to the eye. In the greenhouse, on the other hand, you may so change the position of the plants every week or every month as to present fresh combinations, and in such cases the very change will be pleasing. In further answer we would say that an "OLD SUPPORTER" may do well all that he attempts in his single house. For instance: Place all the Heaths at the coolest end, and where, in favourable weather, whenever the outside temperature is from 35° to 40°, there will be a play of fresh air over them, the opening being contracted or expanded according to the weather. A similar position will suit his Cinerarias that are growing. Those coming into bloom should be placed more in the centre of the house, where they will have a temperature a few degrees higher. The middle of the house will do for Camellias, Oranges, and the softwooded florists' and fancy Pelargoniums. At the warmest end keep the Boronias, Croweas, and the Epacris until the latter begin to open their flowers, when they may either remain, or be placed behind the Heaths or among the Camellias. The Camellias that are late and in good bud, that you wish to come into bloom, may have the warmest end, but as soon as the blooms begin to expand, they will keep much longer at the end that is coolest and more airy. Thus, independently of artificial heat, merely by giving more air at one end of a house than another, a considerable difference in temperature and atmospheric moisture can be obtained in the same house, and plants will thrive all the better in pots when frequently moved, cleaned, the pots washed, the surface dressed, &c.

Camellias and Azaleas.—These are themes that would well fill pages, but we can only spare a few lines to reply to "J. C." Camellias, properly speaking, do not like forcing in winter. They open their buds best and keep them open the longest in an average temperature of 45°, allowing, of course, for sunshine. The forcing that suits them, is to have their wood firm and the buds set early in summer, then they will swell and open their buds early in winter and late in autumn. To have Azaleas early in winter they should be treated in the same way in spring and summer, and then with well-set buds these will soon swell and open their buds when placed in a moist gentle heat, and will remain long in bloom when transferred to the greenhouse or conservatory.—R. I.

DEATH OF MR. WILLIAM HURST.—It is with much regret that we announce the decease of Mr. William Hurst, senior partner of the firm of Hurst & Son, seedsmen, of 6, Leadenhall Street, City, which took place at his residence, 38, Highbury Place, on the 24th of December. He was 69 years of age, and had been ailing for the last two years, and unable to attend to business.

COVENT GARDEN MARKET.—DECEMBER 30.

With the Christmas holidays has passed away what little improvement we had to notice in business here, and stocks are ample. French importations are heavy and not remunerative, and the general tendency in prices is again downwards.

TRADE CATALOGUE RECEIVED.

Charles Turner, Royal Nurseries, Slough.—Catalogue of Seeds for the Kitchen Garden, Flower Garden, and Farm.

TO CORRESPONDENTS.

.. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

COTTAGE GARDENERS' DICTIONARY (T. T.).—If you send a post-office order for 7s. 2d. you can have it, with the supplement bound up with it, free by post. It contains the names of plants introduced into Great Britain down to the end of 1867, translations of the generic and specific names, culture, insects, diseases, operations, structures, &c.

VINES FOR A GREENHOUSE (Bath Subscriber).—We presume you wish to grow plants in summer in addition to Grapes; if so, your Vines must be further apart than if you dispose with plants in summer, or grow such as will endure a considerable amount of shade. Mrs. Pince's Black Muscat, Golden Champion, and Royal Ascent are first-rate Grapes, and will succeed in a greenhouse, a little assistance being given them in dull and cold periods, but we are not prepared to say they will ripen without heat. If you have plants we would not have the Vines nearer than 4 feet apart, placing the end ones 1 foot from the ends, and allowing 4 feet between each Vine, which will give you eight. These may be four Black Hamburgh, two Foster's White Seedling, one Calabrian Raisin, and one Lady Downe's. The size of the border is ample. Charcoal will not answer as a substitute for lime rubbish, but it is an excellent material to form a part of every Vine border; one barrowful to every nine of the other material, will be sufficient. For lime rubbish you may substitute chalk, in pieces from the size of a hen's egg to that of a hazel nut. It may form one-sixth of the whole.

SOWING LARCH, SPRUCE, FIR, AND CRAB SEEDS (J. H. D.).—The seed of Firs, Spruce, and Larch should be sown early in March in light sandy soil. Crab pips may be sown now or before March, and Hawthorn haws now or before the time above named, but the earlier the better. The plants from the latter will not appear next year.

SOWING COLEUS SEED (Idem).—The best time to sow the seed is early in March, in a hotbed.

PLANTING STOCKS FOR GRAFTING (Idem).—Crab, Pear, Plum, and Cherry stocks planted now may be grafted next year, but are best when established a year before grafting. The latter two are better budded than grafted.

BOX EDGING (E. J.).—We fear you have misunderstood us. We did not mean to put an edging to the grass, but to remove the grass verge, and plant in its place an edging of Box. This may be planted from the present time up to April, and may be kept very dwarf and neat by clipping as required. We think it would please you better than an edging of tiles. Tiles are too cold and tame, and we would not place them where Box would live. In small confined places grass edgings or verges are not often satisfactory, and we can with confidence recommend Box, though if you live in a town and your place is much confined it will not thrive, and you will have no alternative but to have tiles in place of Box.

WHITE AND RED CAMELLIAS FOR STANDARDS IN A CONSERVATORY (A. B.).—Alba plena or the old Double White and Competa alba are good whites. Fimbriata is also good and prettily fringed. Dampieri and Kossuth are good scarlets. Monarch, bright red, and Beahm or Lecana superba are calculated to make good heads. They are all decided in colour.

CULTIVATION OF HARD-WOODEN PLANTS (Dulcibella).—We fear we can be of little service to you. Camellias and Ericas can be grown well in a greenhouse amongst a miscellaneous collection of other plants. A separate house is not required, though it is well when there is separate accommodation for every description of plant. Our advice is, state fully to your gardener what you wish, and give him to understand that others with the same means as you are at his disposal have a result such as you wish for. Give him "In-door Gardening," which can be had from our office, free by post, if you enclose twenty postage stamps with your address. Upon any question he may not have found treated of in the Journal we shall be glad to render what assistance we can.

RAISING AUCUBAS FROM SEED (E. B. B.).—It is not an unusual occurrence for Aucuba seed not to grow, as that saved from first-rate flowers is frequently abortive. We have not only been disappointed by seed purchased, but by seed home-saved. It should be sown early in March in pans filled with light rich soil, covering it lightly with fine soil. It should be sown somewhat thickly, and placed in a cold frame, keeping the soil moist but not very wet, and giving air abundantly after the plants appear. In from eight to ten weeks they should be removed to a shady situation, and in June they will be fit to prick off.

COVERING CHERRY TREE WITH FRIGI-DOMO (J. W. K.).—Frigi-domo, we think, is too close a material for covering Cherry trees to protect the fruit from birds, and yet allow of sufficient air for the fruit hanging late. Thin muslin or tiffany would be better, and best of all netting with half-inch meshes, sufficient to keep out birds.

FRUIT-GARDEN ARRANGEMENT (Ignoramus).—We think your garden well laid out, the walks very conveniently placed. On the right hand of the walk No. 2, the border being 15 feet wide, we would have two rows of Pears on the Quince stock, planting the first row 3 feet from the walk, and allowing 7 feet from row to row, and ½ feet from tree to tree. They should be pyramids or bushes, whichever you prefer, and the kinds—Alexandre Lambre, Citron des Carmes, Colmar d'Éto, William's Bon Chrétien, Fondante d'Antoine, Dauré, Diel, Beurré d'Arcberg, Bergamotte Esperen, Louise Bonne de Jersey, Baronne de Mello, and Zéphirin Grégoire. On the other side of the walk No. 2 we would have Apple trees as lateral cordons, 1 foot from the walk, and 6 feet apart. You will see a list of kinds at page 340 of the present volume. In the border to the right of No. 3 walk we would have pyramid Apple trees at the same distance apart as the Pears, and on the other side continue the lateral cordon Apples, and we would have them to the right and left of No. 1 walk. In the border to the right of No. 5 walk we would have a row of vertical cordon Pear trees, planting them 2 feet apart, and the same distance from the walk, and would not allow them to exceed 7 feet in height. On both sides of the central walk No. 4 we would plant pyramid Plum and Cherry trees on the Mahaleb stock 6 feet apart, and 3 feet from the walk. Of Cherries—May Duke, Late Duke, and Florence; and of Plums—Jefferson, Kirke's, Green Gage, July Green Gage, and Coe's Golden Drop. The border to the left of No. 1 walk will be suitable for Strawberries, and you may have a row of them to the right of No. 2, 3, and on both sides of No. 4 walk, about 15 inches from the edge of the walks, which will, no doubt, be enough. You will by this arrangement have the central portion of two beds or borders—that is, between No. 5 and 4, and between No. 4 and 3 walks, for Raspberries, Gooseberries, and Currants, the latter two of which should not be nearer the other trees than 6 feet, allowing ½ feet between the rows, and 3 or 4 feet between the plants, according to their size. The Raspberries should be 7 feet from the fruit trees, and 5 feet ought to be allowed between the rows, and 3 feet between the stools. The Pears should be on the Quince, the Apples on the English Paradise stock, and the Cherries on the Mahaleb. We have given what we consider a fair proportion of each description of fruit. The fan mode of training is not eligible for the form of trees above named. You will find a list of the trees best suited to your purpose in page 387-388, referred to by you. The distances there given for the trees, &c., are, owing to the circumstances, less than yours, but the latter are all the better.

BOTTOM HEAT (S. S.).—We do not see why your plan will not answer.

JOINTS OF HOT-WATER PIPES LEAKING (B. West).—We have known several cases of leakage when the joints of hot-water pipes were run with molten lead. If you had rammed the joints well, as you say, with oakum, and then with lint and red or white lead in the soft state, there would have been no leakage. As a partial remedy now, we would drive the lead all round as much as possible, then empty the pipes and use red lead all round, the more of it the better. Let it settle for twenty-four hours before admitting the water, and then paint the joints. If this do not answer you will have to melt the lead in the joints by means of a brazier of charcoal beneath them, and then fill as above, or with iron filings and ammonia in the usual way.

GALVANISED WIRE FOR TREE-TRAINING (H. F. R.).—Galvanised wire is the best that can be used for training Peach and Nectarine trees against open walls. It does not rust, and never requires painting as the ordinary wire does. We have seen instances of the gumming and cankering of the young shoots where galvanised wire has been used (we believe the very instances which have given rise to its objection), the cause of which must be ascribed to some other outward influence. Wired walls are very neat, and facilitate training, but the trees trained on them are about as liable to the attacks of insects as those that are nailed in the usual manner.

ORCHARD-HOUSE ARRANGEMENT (A. D.).—The plan you propose will answer. If your wall will admit of it, have the back wall 12 feet above the floor, and the front, partly of glass, from 5 to 6 feet. You may vary these heights respectively. We have a useful house, height at back 11 feet; width, 11 feet; height in front, 4½ feet. When you have settled on the plane of the roof, take length and breadth, and that will show very nearly the number of feet of glass required. As fruit is your object have nothing to do with a stage in the house. Devote the back wall as you propose to Peach trees, and the front of the house to trees in pots partly plunged in the ground. The simplest way to do this is to have a narrow wooden-trellised path to walk upon at 3 feet from the back wall, and then fill the front thinly. In an 18-foot length, three Vines on the verge will be better than nine, as the more the Vines shade the less will the other trees succeed. A small iron stove lined with firebrick, which will cost about 50s., will be the best for heating.

PERSIAN MELON SEED.—"A. A. C." and others inquire where they can purchase seed of the Persian Melon, described by London, and in the "Transactions" of the Royal Horticultural Society. We shall be obliged by reply.

GRASS UNDER A TREE'S SHADE (R. W. Burleigh).—The Grass which best endures such shade is the Sweet-scented Vernal Grass, Anthoxanthum odoratum. It may be obtained true of any of the well-known seedsmen who advertise in our columns. No treatment is needed except forking the surface just before sowing the seed in early spring, and rolling lightly after sowing.

INSECTS (A. T. E.).—The insect you have sent, which clusters very thickly in warm places in cracks and crevices about your house (having

apparently made their first appearance during the past summer), is the *Blatta lapponica*, a small species of cockroach, common in Lapland and the north of Europe, which is occasionally met with in this country. It

must be attacked in the same way as the common cockroach. Boiling water or phosphorus paste, to be had at any chemist's, will destroy them. —W.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the week ending December 29th.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

PROTEST AGAINST TRIMMING FOWLS FOR EXHIBITION.

WE, the undersigned exhibitors of poultry, desire to record our emphatic protest against the widely prevalent and fast increasing practice of trimming or altering the plumage of fowls for exhibition. We cannot but feel that such practices are not only in themselves fraudulent and unjust, but tend to place all real amateurs at the mercy of a few skilled and unscrupulous individuals; and if unchecked by committees and judges, must ultimately so degrade the character of poultry exhibitions that no honourable man will take part in them.

We consider that to make any alteration in the plumage or appearance of fowls beyond washing and cleansing, or the removal of an occasional damaged feather, with the sole exceptions of dubbing Game or Game Bantams and dressing the faces of Spanish, is fraudulent, and should be dealt with in every case by disqualification, and publication of the offender's name—such penalty to be as far as possible inflicted by the judges themselves, but to be enforced by the committee of a show in case of oversight, if proved to their satisfaction, even after the awards are made.

And without binding ourselves at present to any specific line of action, we pledge ourselves in general to oppose both judges and exhibitions which shall refuse to carry out these moderate conditions, and to support by all means in our power such as shall, by their action, prove their anxiety to promote fair and honourable competition. (Signed)

Elizabeth Allsopp, Hindlip Hall, Worcester.

*T. W. Amis.

William Blinkhorn, Waterdale, St. Helen's.

John Bowen (the Rev.), Llangorse Vicarage, Talgarth.

M. Brooksbank, Manchester.

*Louisa Charteris (Lady), Eccles Hall, Attleborough.

A. K. Cornwall (the Rev.), Bencombe, Dursley.

*Frederick Crook, Forest Hill.

James F. Dixon, Cotgrave, Nottingham.

James Ellis (the Rev.), Bracknell.

W. Baker Etches, Whitechurch Salop.

H. W. Fitzwilliam (the Hon.), Wentworth Woodhouse.

W. C. W. Fitzwilliam (the Hon.), Wentworth Woodhouse.

John Gardiner, Beaufort House, Terrell Street, Bristol.

L. Harvey, Miss, Sarisbury, Southampton.

Francis B. Heald (the Rev.), Whitmoor, Nottingham.

Alfred Heath, Calne.

A. Herbert, Egham, Surrey.

Edmund Herbert, Powick, Worcester.

Sarah R. Herbert, ditto.

*Joseph Hinton, Hinton, near Bath.

Alice Hunt, Alderwasley, Derby.

J. R. Jessop, Beverley Road, Hull.

Keith Jopp, Aberdeen.

H. B. Lane (Lieut.-Col.), Bracknell.

Edward Leech, Greave House, Rochdale.

Henry Lingwood, Barking.

Horace Lingwood, Martlesham, Woodbridge.

G. Leicester Macpherson, Bracknell.

H. M. Maynard, Holmewood, Ryde, Isle of Wight.

John F. Newton (the Rev.), Kirkby-in-Cleveland.

John Pares, Postford, near Guildford.

*F. Powell, Knaresborough.

John Robinson, Vale House, Garstang.

John R. Rodbard, Aldwick Court, Wroughton.

H. Shumack, Southwell, Notts.

Uriah Spary, Dunstable.

Henry V. Story.

Thomas Stretch, Ormskirk.

Richard White, Broomhall Park, Sheffield.

Robert B. Wood, Woodland Park, Uttuxeter.

Lewis Wright, Kingsdown, Bristol.

William Wykes Wolvey, Hinxley.

The exhibitors whose names are accompanied by an asterisk (*), have specially requested that they should be distinguished as including the dressing of Spanish faces in their protest against trimming; and I have reason to believe that half the remainder would have done so had there been time to consult them on the point. Having the chief responsibility of drawing up the terms of the above, I can only say that in inserting the above exception, I was guided solely by what I thought practicable, being perfectly conscious that the practice of trimming Spanish is in itself utterly incapable of defence. But there are some peculiar facts in this special case. An exhibitor who signs this document, some time since protested repeatedly against the practice in vain. He did more, he persevered (heroically, I consider), in showing undressed birds, losing invariably, for a long time. It is within my own personal knowledge, that a well-known judge expressed his opinion at a first-class show, to the effect that Mr. — "deserved to lose for not trimming his faces like the rest did." [?] Whether this opinion came to that gentleman's ears I cannot say, but at length he got weary of protesting, and publicly announced, through the recognised organs of the fancy, that he should in future trim, as he found it was no longer considered dishonourable. He immediately began to take prizes, and after trying both plans, writes me in the note accompanying his signature, he does not consider that "the beauty of the birds can be seen without it." Now, remembering the facts stated above, which may be new to some, I can hardly put him on the same level with a man who fastens a false tail to a Game Bantam. He was literally driven into trimming by the judges themselves. At the same time I must express my entire concurrence in the opinion, that Spanish fowls, equally with others, ought to be shown in a natural state, and that, if not hopeless, this practice also should be put down. But while I believe we have trimming in general very much in our own power to stamp out, even if judges will not act, this particular point seems to me, so far as regards the possibility of abolishing it, to rest entirely with the judges, seeing that there is no sense of fraud on the part of Spanish exhibitors to appeal to.

I wish also to say, that "publication of the offender's name" we only regard as possibly necessary if honest exhibitors be driven to extremities. If judges, now their attention is drawn to the matter, use their power and influence legitimately, as we trust they will, the simple ticket of disqualification on the pen at a show will be enough. The pen may even, as I have been reminded by an eminent judge, and an equally eminent exhibitor, have been just previously purchased, and shown quite innocently, and in any case I would never debar an offender, however gross, from acknowledging his error, and showing again.

I am most anxious to disclaim any idea of casting censure on those gentlemen who perform the arduous duties of either judges or committees. The evil practice in question has been so gradually and insidiously increasing, that it was very possible till quite lately scarcely to notice it. Then, one of our best judges did express to a friend of mine his intention to "disqualify right and left," at Birmingham, if

needful. That he did not, I can only attribute to the fact that trimming there was so gross and general, he may have been fairly frightened at the task before him. I know what judging often is, and that the first judge who shall do his duty may expect such a "black-guarding" as any gentleman may be pardoned for shrinking from. Still, truth is truth, and the last paragraph was chiefly meant as an assurance to arbitrators, that whatever the consequence may be of doing justice, they shall have the support of the best names in the fancy. And only in the improbable event of their deliberate refusal, now that attention has been drawn to the matter, to act righteously, will any censure attach to them in the matter.

Finally, Let me apologise to any who may not have received a copy of the protest for signature. It has been conducted entirely by correspondence, and mere number of names was no particular object. In some cases former acquaintances or friendly intercourse guided the application; but want of time on my own part, and an anxiety to publish the document at least before the last great show of the season, prevented many desirable names from even receiving a copy. I can only, while recording the fact that nearly all applied to have gladly signed, most of them adding kind expressions of the warmest sympathy, ask those who have not had an opportunity of doing so, to accept my sincere apologies for the apparent neglect, and I have no doubt that the Editors will, if any desire it, add their names in a subsequent list, as desirous of joining in the movement.—NEMO.

[We will readily publish not only additional names, but suggestions towards preventing the fraudulent practices thus protested against. We would not admit any exceptions except those relating to dubbing.—EDS.]

THE BIRMINGHAM MEETING OF POULTRY EXHIBITORS.

ALLOW me to suggest the following additions to the resolutions unanimously adopted at the above meeting—viz.

1st, The judges, without knowledge of the names or residences of exhibitors, shall award the prizes by reference to the number affixed to each pen, and solely in accordance with the merits of the birds.

2nd, No exhibitor, or other person, shall be allowed to be present while the judges are making their awards.

3rd, That the secretary and other officials immediately connected with the show, be prohibited from exhibiting either in their own names or in those of other persons.

I think the necessity of these restrictions will be acknowledged by the great majority of exhibitors, for what can be more unsatisfactory than the plan at present generally followed? A catalogue containing the names of all exhibitors, with the numbers of their pens, is published before the awards are made, and placed in the hands of the judge, who makes his awards, marking off the prizes on the margin opposite to each name. Of this fact I have the strongest evidence, in one case at least, and there is a general feeling amongst exhibitors that it is the rule, and not the exception, at our local shows. How much better to do away with all suspicion of unfairness by adopting Rule 1. However just our judges may be, and I for one believe that as a rule they conscientiously award the prizes according to the merits of the specimens, judges are mortals, and a great name in any particular class may exercise an influence of which even the judge himself is almost unaware.

The practice condemned in Rule 3, has increased so much of late, and is so very objectionable, that two opinions can hardly exist respecting it. In the early days of my exhibiting, even members of the committee were too modest to exhibit their own birds. Rule 2 requires no defence; except, perhaps, where one judge only is employed, an assistant should be allowed.

In the hope that Mr. Walker may undertake the somewhat, I fear, difficult task of making these few additions to the excellent resolutions published in your last number, I beg to ask him to add my name to his list of approvers.—GEORGE RAXSON, *Bordyke, Tonbridge.*

OAKHAM POULTRY SHOW.

WHEN men have given much time and care for no other purpose than for the public good, they are surely entitled to the sympathy, if not the praise and thanks, of those for whom they have more particularly laboured; yet there are some who are always too glad and ready to heap insult upon injury, and pronounce everything sour they cannot grasp. As one of the committee of the Oakham Poultry Show, I must select a few of the many complimentary remarks accorded to us by

exhibitors who have written in those terms since the close of our exhibition. 1st, Dr. Campbell writes, "I was much pleased with the condition the birds returned in from Oakham, contrasting most favourably with some other shows." 2nd, Mr. W. Tiekner, "Allow me at the same time to thank you for the care bestowed on my fowls, they arrived home quite safe, apparently none the worse for their long journey." 3rd, the Rev. G. Raynor, Tonbridge, "And to thank you for the care bestowed on my birds, which reached home in excellent condition." 4th, Mr. Tomlinson, Newark, "I am obliged for the attention my birds had whilst at your show, and for the good condition I received them in on their return." 5th, Mr. G. W. Boothby, Louth, "I received the fowls back again in very good condition." Surely I need quote no more from such letters, because I feel these are already more than enough to prove that great care and attention were paid to the many valuable birds entrusted to our care at the late exhibition, contrary to the assertion put forth in your impression of December 10th, by your correspondent "J. W."

I make bold to say we afford such comfort to all birds sent us as is seldom afforded at other shows, and to which comfort I very much attribute their clean and capital appearance and condition when reaching their owners again—viz., that we have some good, clean, dry straw cut into long chaff, and their pens kept constantly and well bedded, thereby keeping their feathers from getting dirty, and making their new lodgings quite warm and comfortable.—WILLINGHAM FOWLER.

NOTES AT LEIGHTON BUZZARD.

A VISIT to the Leighton Buzzard Poultry Show has suggested one or two points to my mind, which you may consider worthy of notice in your Journal.

First, the Corn Exchange in which the Show was held is admirably adapted for the purpose. A handsome building in itself, it affords ample light and air, while the birds are exposed to no risk, such as appears to have been the case at Ashford and Oakham. All the pens could be readily inspected, and the arrangements generally were good. Great credit is due to Mr. Gotto, the Secretary, upon whom the lion's share of the work seems to have fallen, and who was indefatigable in his endeavours to make matters work well, and, moreover, succeeded. I was glad to find that the entries were one hundred more in number than last year, and that the financial success of the Exhibition was assured.

One change, however, might be made with advantage before next year. In the prize list it was stated, that prizes in certain classes would be awarded to a "cock and one hen." To my surprise I found cockerels and pullets entered in these classes, and some of them noticed by the Judge. Of this I do not complain; it would, however, simplify matters, and probably increase the entries, if in future the words "of any age," were added. Had they been so in this case, I certainly should have sent some birds which remained in their yards.

A question arose there upon which I should like to have the opinion of experienced fanciers. "What fault can you find," I asked of an eminent breeder who is probably one of the best judges in England, "with those birds?" pointing to some Dorking cockerels which I happen to know.

"They are excellent birds, one of them particularly, just the colour I like, with a faultless comb; but there is, I fear, something wrong in your breed. They each have a white feather in their tails."

"Surely this is no defect in Coloured Dorkings," said I. "In Silvers, I admit a white feather is fatal to success; but the case here is different."

"Go to the large shows," he replied, "and you will never see a prize bird with a white feather in his tail."

Puzzled and somewhat concerned, I mentioned the matter to another friend, one or two of whose birds were noticed this year at Birmingham.

"I think Mr. — is wrong, white feathers are quite allowable in Coloured Dorkings."

Arrived at home, I went to my poultry shelf, and turning to "Bailly on Fowls," read as follows—"Exhibition fowls, Dorkings, cocks, black, or black and white breast and tail, light hackle and saddle." Not content with this, I proceeded to consult Mrs. Ferguson Blair, who in her "Henwife," writes thus—"Tail, black, large, and sweeping; a white feather will not cast an otherwise perfect bird."

Here the doctors somewhat differ, which of them is right

My own opinion, I confess, is in favour of the lady, but I should like to hear what the learned say on the subject.—E. M. B. A.

[When there is but one class for a breed, it is understood that all ages are eligible to compete. The words cock and hen are not indicative of anything but sex. We fear "one of the best judges in England" enjoys a reputation he does not deserve, and that he visits very few of the large shows. White feathers are not even a disadvantage in the Coloured Dorking classes, and the breeders of Silver-Greys know how often they are produced, even by their best and purest birds.

The truth is, Dorkings are not birds of feather. The Silver-Grey class was formed to meet the views of those who believed in colour, and the most successful know better than anyone else, that white tail feathers will come.

It was attempted both in Scotland and Ireland, to admit none to be genuine but the Silver-Greys. Those who did so, however, have given way, little by little, till white feathers are overlooked. They are as wise as the Mahomedans, who beg their prophet to shut his eyes when they drink wine.]

TRIMMING AND OTHER ARTIFICES AT SHOWS.

EVERY honest exhibitor will rejoice at "Nemo's" pluck—not at the feathers, but in bearding some of the exhibitors. The remarks of "our Editors," appended to Mr. Stewart's defence (p. 4), are, I humbly think, perfectly just. I confess I would go further than "NEMO" proposes to go. I have before now in the pages of "our Journal" expressed my own opinion that all trimming, except of an occasional foul feather, is unlawful, and should be a disqualification. In the case of the vulture cock, the discovery of the practice, especially in heavily-feathered specimens, seems to prove what I long ago maintained in the vulture-cock controversy, that heavy-leg feathering and covered hocks go together; that, in fact, the former depends somewhat on the latter. I have seen beautiful first-prize Brahmas in their pens heavily feathered, and I have felt convinced that the hocks were tampered with. Some of them, possibly, might not have had an objectionable vulture hock, and I cannot but think the "plucking" practices have arisen in consequence of the extreme views of some judges on the matter of hock feathers. Be this as it may, there is no question that it is high time the practice were put an end to.

We must not, however, stop at the hocks. A friend of mine called on a Hamburg breeder, whose name is often seen in the prize lists. Comb-trimming was going on at the time. A noted judge once said in my hearing, "Ah! that is a very fair bird, but he has a twisted comb. If I had him, I would set it right in a month, and it should never droop again." Now, is this just? Is it just to remove a sprig from a Dorking or Spanish cock's comb? I ask for information. Again, is it allowable to remove the horns of a Polish cock? they are very objectionable. I myself think it decidedly unjust. Birds reserved wholly for breeding may be served as we like. There may be reasons why we should remove defects from the eyes of the hens. I cannot see why Spanish and Game should be exempt from censure. It is the allowing it in these breeds that has led to its adoption in others. I should like to see Game fowls exhibited undubbed; indeed, there is no question that dubbing a Game cock gives it an advantage in a cup competition possessed by no other breed. The Game cock may have owned a comb exceedingly objectionable, but the clever dubber has removed all traces of the defect. Undubbed, the Game bird must have resigned the "pride of place;" this I consider an unfair advantage. We have shaken off the trammels of the cockpit, why should we retain the dubbing and trimming which originated there?

If Committees intend to disqualify for trimming, it should be a rule that notice of the reason for disqualification should be affixed to that pen, and entered in the prize list.—Y. B. A. Z.

Will you allow me to add my thanks to "NEMO" for his just remarks in your valuable Journal upon the unfair and dishonest practice of trimming birds at poultry exhibitions? At the last Birmingham Poultry Show I purchased by auction a Cochín-China cock for £7 15s. When he arrived at home, and could be examined, to my great disappointment I found that a number of feathers had been removed from his hocks, and have no doubt he is naturally a vulture-hocked bird, and a bird I should not have purchased with such an objectionable defect. Unless some notice be taken of these dishonest practices by the judges of poultry, it will deter many from buying

birds which they cannot examine. If judges do not disapprove of such practices, it ought to be so stated, in order that all exhibitors may trim at their own discretion.—H. C. WOODCOCK, *Rearsby, Leicester.*

MANCHESTER POULTRY SHOW.

THIS great Show was held in the Zoological Gardens, Belle Vue, Manchester, on the 21st, 26th, and 28th of December. The entries of poultry amounted to 1054, of Pigeons to 316. The following list of the awards, from its length, and the names which it contains, is of itself a testimony of the general merit of the Show, and we hope to give further details next week.

DORKINGS (Coloured, except Silver-Grey).—*Cock*.—First, Admiral W. Hornby, Knowsley Cottage, Prescot. Second, J. Longland, Grendon, Northampton. Third, J. Martin, Claines, Worcester. Highly Commended, T. Statter, Stand Hall, Whitefield, Manchester. Commended, Mrs. F. S. Arkwright, Etwell Hall, Derby. *Hens*.—First, Admiral W. Hornby. Second, G. Clarke, Long Sutton. Third, Duke of Newcastle, Clumber. Highly Commended, Mrs. F. S. Arkwright; R. Smalley, Lancaster; J. White, Warley; Hon. H. W. Fitzwilliam, Wentworth Woodhouse. Commended, A. Bamford, Middleton, Manchester; T. Statter; L. Patton, Bishop's Hall, near Tamerton.

DORKINGS (Coloured, except Silver-Grey).—*Cockerel*.—First, T. Statter. Second, E. Ryder, Harrytown Hall, Stockport. Third, Mrs. F. S. Arkwright. Highly Commended, D. Hardie, Sorbie, Langholm; Mrs. F. S. Arkwright; Admiral W. Hornby; L. Patton. Commended, Mrs. F. S. Arkwright. *Pullets*.—First, Mrs. Arkwright. Second, Admiral W. Hornby. Third, Hon. H. W. Fitzwilliam. Highly Commended, Duke of Newcastle; F. Schofield, Brookfield, Wilmshurst; T. Statter; Miss Milne, Otterburn; T. Raines, Bridge Haugh, Stirling; J. Martin; J. White; Hon. H. W. Fitzwilliam; H. Pickles, jun., Easby, Skipton. Commended, Mrs. F. S. Arkwright.

DORKINGS (Rose-combed).—First, J. Martin. Second, Duke of Newcastle.

DORKINGS (Silver-Grey).—*Cock*.—First, R. Smalley. Second, T. L. Jackson, Eush of Ewes, Langholm. Third, C. W. Brierley, Middleton. Highly Commended, Mrs. F. S. Arkwright; S. H. Scott, Iobdale. Commended, W. H. King, Mass Mills, Rochdale. *Hens or Pullets*.—First, T. Raines, Lyde, Isle of Wight. Second, Rev. W. J. Mellor. Third, T. L. Jackson. Highly Commended, J. Longland; R. Smalley; T. Statter.

DORKINGS (White).—First, H. Lingwood, Barking, Needham Market. Second, D. Parsons, Caudon, Preston. Commended, J. Robinson, Garstang.

SPANISH.—*Cock*.—First, Hon. Miss Douglas Pennant, Penrhyn Castle, Bangor. Second, E. Brown, Sheffield. Third, H. Beldon, Goitstock, Bingley. Commended, W. A. Taylor, Manchester. *Hens*.—First, H. Beldon. Second, J. Thresh, Bradford. Third, T. & E. Comber, Middleton Hall, Warrington. Highly Commended, W. A. Taylor; Hon. Miss Douglas Pennant; J. S. Senior, Dewsbury; J. Newton, Silsden, Leeds. Commended, E. Brown; Hon. Miss Douglas Pennant.

SPANISH.—*Cockerel*.—First and Second, R. Teebay, Fulwood, Preston. Third, T. & E. Comber. Highly Commended, H. Beldon; W. R. Bull; W. R. Bull, Bristol; Purch & Foulter, Sheffield. Commended, W. A. Taylor; R. Teebay. *Pullets*.—First and Third, J. Thresh, Bradford. Second, T. & E. Comber. Highly Commended, A. Heath, Calne; W. Rouse; W. A. Taylor; R. Teebay; J. Newton. Commended, J. Walker, Burslem.

COCHIN-CHINA (Cinnamon and Buff).—*Cock*.—First, W. A. Taylor. Second, H. Mapplebeck, Moseley, Birmingham. Third, Mrs. R. White, Sheffield. Highly Commended, J. C. Brierley, Lauriston House, Rochdale; Duke of Newcastle; H. Mapplebeck; C. W. Brierley; C. Sidgwick, Ryddlesden Hall, Kelkley; W. A. Taylor; Mrs. R. White. *Hens*.—First, J. Siebel, Timperley. Second and Third, H. Mapplebeck. Highly Commended, T. Pott, Woodlands, Bury; C. W. Brierley; W. A. Taylor; J. Catted, Birmingham; Mrs. R. White; J. Dyson, Glossop. Commended, Duke of Newcastle.

COCHIN-CHINA (Cinnamon and Buff).—*Pullets*.—First, H. Mapplebeck. Second, Mrs. A. Woodcock, Rearsby. Third, F. W. Rust, Hastings. Highly Commended, J. C. Brierley; A. Darby, Bridgenorth; Mrs. A. Woodcock; Mrs. Christy, Glyndebourne, Lewes. Commended, C. W. Brierley; H. Mapplebeck; T. Stretch, Ormskirk; C. Sidgwick; W. A. Taylor.

COCHIN-CHINA (Brown and Partridge-feathered).—*Cock*.—First, E. Tadman, Whiteburch. Second, H. Crossley, Broomfield, Halifax. Third, R. White, Sheffield. Highly Commended, C. W. Brierley; T. Stretch. *Hens*.—First, E. Tadman. Second, C. Sidgwick. Third, C. W. Brierley. Commended, H. Crossley; T. Stretch; H. Lingwood.

COCHIN-CHINA (Brown and Partridge-feathered).—*Pullets*.—First, J. A. Taylor. Second, C. Sidgwick. Third, H. Crossley. Highly Commended, R. Andrew, jun., Harpurhey; J. A. Taylor; E. Tadman; H. Lingwood, Martlesham. Commended, E. Shaw, Plas Wilnot, Oswestry; T. Stretch.

COCHIN-CHINA (White).—*Cock*.—First, R. Smalley. Second, J. A. Taylor. Highly Commended, R. Chase, Balsall Heath, Birmingham; R. Smalley. *Hens or Pullets*.—First and Second, R. Smalley. Highly Commended, R. Chase; C. W. Brierley.

BRAMA FOOTRA (Dark).—*Cock*.—First, J. Siebel. Second, W. Hargreaves. Third, Rev. E. Alder, Etwell Vicarage, Derby. Equal Third, E. Ryder. Highly Commended, J. Anderson, Meigle, N.B.; E. Leech, Rochdale; Duke of Newcastle; R. White; B. Wharton, Sheffield; Hon. Miss Douglas Pennant. *Hens or Pullets*.—First, H. Lingwood, Martlesham. Second, T. Pomfret, Preston. Third, W. Hargreaves, Bacup. Highly Commended, E. Leech; Hon. Miss Douglas Pennant.

BRAMA FOOTRA (Light).—First, H. Lacy, Hobden Bridge. Second, H. Dowsett, Pleshey, Chelmsford. Third, J. Pares, Postford, Guildford. Commended, Rev. G. Hustler; W. Whiteley, Sheffield. *Hens or Pullets*.—First, H. Lacy. Second, J. Pares. Third, H. Dowsett.

POLISH (Any variety).—*Cocks*.—First, N. Nichols, Peel, Isle of Man. Second, G. Adkins, Lightwoods, Birmingham. Third, W. Harvey, Sheffield. Highly Commended, H. Beldon; P. Unsworth, Lowton, Newton-le-Willows; J. S. Senior. *Hens or Pullets*.—First, J. S. Senior. Second, G. E. Adkins. Third, H. Beldon. Highly Commended, H. Beldon; P. Unsworth; W. Harvey. Commended, G. E. Adkins.

CRÈVE-CŒUR.—First, Col. Stuart Wortley, Grove End Road, London. Second, W. Blinkhorn, Waterdale, St. Helens. Third, J. C. Cooper, Cooper Hill, Liscard, Highly Commended, H. Beldon; W. Blinkhorn; Hon. H. W. Fitzwilliam.

HOUDAN.—First, J. Siebel. Second, W. O. Quibell, Newark. Highly Commended and Commended, L. Biney.

LA FLÈCHE.—Prize, J. C. Cooper. Highly Commended, Col. Stuart Wortley.

GAME (Black-breasted Reds).—*Cock.*—First, C. W. Brierley. Second, L. Biney. Third, S. Wilcox, Oswestry. Highly Commended, E. Aykroyd, Bradford; J. Linnel, Auster, Coventry; C. W. Brierley; G. R. Smith, Scarborough; C. Challoner, Whitwell, Chesterfield. Commended, Duke of Newcastle. *Hens.*—First, C. Richardson, West Gorton. Second, E. Aykroyd. Third, L. Biney. Commended, Duke of Newcastle.

GAME (Black-breasted Reds).—*Cockerel.*—First, J. Challoner. Second, S. Matthew, Stowmarket. Third, Rev. T. O'Grady, Hogsdon Vicarage, Ashbourne. Highly Commended, Rev. T. O'Grady; J. Holland, Manchester; J. Linnel; J. Stubbs, Stafford; S. Wilcox. Commended, Duke of Newcastle; G. Pounder. *Pullet.*—First, J. Poole, Ulverston. Second, S. Matthew. Third, G. Nolde, Staincliffe, Bailey. Highly Commended, Rev. T. O'Grady; G. R. Smith; J. W. Pope. Commended, Rev. T. O'Grady; E. Toder, Little Carlton, Newark.

GAME (Brown and other Reds, except Black-breasted).—*Cock.*—First and Second, J. Wood. Third, S. Matthew. Highly Commended, L. Biney; R. Payne, Brierfield, Burnley; F. Sales, Cromie, Commended, J. Hodgson, Whittington; C. Challoner. *Hens.*—First, C. W. Brierley. Second, G. R. Smith, Scarborough. Third, F. Sales. Commended, J. Anderson; W. Bourne; C. Challoner.

GAME (Brown and other Reds, except Black-breasted).—*Cockerel.*—First, C. W. Brierley. Second, J. Hodgson. Third, T. Mason, Green Ayre, Lancaster. Highly Commended, W. Bourne, Heavily, Stockport; C. W. Brierley; J. Wood; S. Matthew; F. Sales; C. Challoner. *Pullets.*—First and Second, C. W. Brierley. Third, J. Woods. Highly Commended, E. Brough, Ball Haye Park, Leek; J. Woods; R. Payne, Ederfield, Burnley. Commended, J. Anderson; J. Bonness, Newchurch.

GAME (Duckwings and other Greys and Blues).—*Cock.*—First, E. Aykroyd. Second, H. M. Julian, Hail. Third, E. Conderdine, Littleborough, Manchester. Highly Commended, J. Holland; J. Halsall, Ince, Wigan; C. Travis, Frogland, Sheffield. *Hens.*—First, A. K. Briggs, Bradford. Second, G. Noble. Highly Commended, W. Bradley, Worcester.

GAME (Duckwings and other Greys and Blues).—*Cockerel.*—First, Miss E. Sedler, Whitechurch. Second, J. Halsall. Highly Commended, G. Noble; S. Matthew; W. J. Cope, Barnsey; Rev. W. J. Mellor, Ryde, Isle of Wight. Commended, D. Ashworth, Halifax; J. Thresh, Whitechurch; Rev. W. J. Mellor. *Pullet.*—First, J. Halsall, Ince. Second, W. J. Cope. Third, A. K. Briggs. Commended, W. Bradley; J. Holland; W. Parker, Clay Cross.

GAME (Any variety not before named).—*Cock.*—First, C. W. Brierley. Second, Rev. T. O'Grady. Highly Commended, A. D. Edwards, Hindersfield; Furness & Bamber, Accrington; Fould & Hargreaves, Burnley; J. W. Thompson, Southwarram. Commended, E. H. Woodcock, Holme, Wigan. *Hens or Pullets.*—First, R. Butcher, Crosswell. Second, C. W. Brierley. Highly Commended, J. Halsall.

HAMBURGERS (Black).—*Cock.*—First, J. Garside, Longlands, Slaithwaite. Second, H. Mason, Denton. Third, Rev. W. Serjeantson, Highly Commended, J. M. Kilvert, Ludlow; J. Smith, S. Butterfield, Keighley. *Hens or Pullets.*—First, Mason & Walker, Denton. Second, S. Butterfield. Third, H. Mason. Highly Commended, J. Garside; J. M. Kilvert; J. Lancashire, Chadderton; G. Lingard, jun., Birmingham; C. Sidgwick.

HAMBURGERS (Golden-spangled).—*Cock.*—First, J. Walker. Second, J. S. Senior. Third, N. Marlor, Denton. Highly Commended, J. Mann; J. Roe, Haafeld, Manchester; T. Scholes, Hollingwood. Commended, J. Buckley, Tannton, Ashton-under-Lyne; E. Brierley, Heywood; N. Marlor; T. Scholes. *Hens or Pullets.*—First, J. Buckley; J. Ogden. Third, J. Ogden, Hollingwood. Highly Commended, E. Brierley; P. Greenwood, Rochdale; J. Mann; J. Ogden; J. Roe; J. Wild, Ashton-under-Lyne.

HAMBURGERS (Silver-spangled).—*Cock.*—First, J. Smith. Second, J. Fielding. Third, J. Walker. Highly Commended, H. Beldon; J. Fielding, Newchurch, Manchester. Commended, J. S. Senior. *Hens or Pullets.*—First, Ludham & Ashton, Mottram. Second, H. Pickles, jun. Third, J. Fielding. Highly Commended, H. Beldon; Ludham & Ashton.

HAMBURGERS (Golden-pencilled).—*Cock.*—First, J. Bonness. Second, T. Wrigley, jun. Tonge Hall, Middleton. Third, H. Beldon. Highly Commended, H. Beldon; C. Sidgwick. Commended, H. Pickles, jun. *Hens or Pullets.*—First, W. R. Park. Second, H. Beldon. Third, T. Wrigley, jun. Highly Commended, J. Walker, Knarsborough.

HAMBURGERS (Silver-pencilled).—*Cock.*—First, J. Walker. Second, H. Beldon. Highly Commended, G. Clarke; T. & E. Comber; T. Sharples, Rawtenstall. Commended, H. Pickles, jun. *Hens or Pullets.*—First, H. Beldon. Second, H. Pickles, jun. Highly Commended, J. Walker; J. S. Senior.

GAME BANTAMS (Black-breasted Reds).—*Cock.*—First, H. Shumach, Southwell, Notts. Second, W. & H. Buckley. Third, J. P. Robinson, Sunderland. Fourth, Rev. C. H. Crosse, Cambridge. Highly Commended, W. & H. Buckley, Accrington; G. Noble; Stuttard & Hayes, Accrington; W. F. Entwistle, Leeds; Bowman & Pearson. Commended, J. H. Bindloss, Blime Hall, Fouldton; L. Biney, Manchester; W. & H. Buckley; J. Bamires, Horton; Furness & Bamber; J. Halsall; J. W. Morris, Rochdale. *Hens or Pullets.*—First, J. Elmires. Second, J. Crossland, jun., Wakefield. Third, J. Henshall, Salford. Highly Commended, H. Ashton, Polefield Hall, Prestwich; Rev. E. S. Tiddeman, Brentwood; J. W. Morris; H. Shumach; W. F. Entwistle. Commended, J. H. Howe, Denton; D. Parsons.

GAME BANTAMS (Any variety except Black-breasted Reds).—*Cock.*—First, J. Crossland, jun. Second, T. Sharples. Third, Mason & Charlesworth. Highly Commended, R. Cooke, Nottingham; J. J. Cousins, Chapel Allerton, Leeds; C. W. Brierley; H. Shumach; J. Poole. Commended, G. Birtwistle; Mason & Charlesworth, Chesterfield; J. Bamires; J. Wardle, Denton. *Hens or Pullets.*—First, L. Biney. Second, J. Crossland, jun. Third, T. Sharples. Highly Commended, R. Cooke; H. Ashton; G. Smith. Commended, E. Toder.

BANTAMS (Any variety except Game).—First, H. Pickles, jun. Second, Miss A. Woodcock. Third, W. J. Cope. Highly Commended, S. A. Wyllie, East Moulsey; J. H. Taylor. Commended, N. Marlor; Ludham & Ashton; J. W. Morris; W. H. Tomlinson, Newark.

ANY OTHER VARIETY.—First, Furness & Bamber (Cuckoo Cochins). Second, J. C. Cooper (Sultans). Very Highly Commended and Highly Com-

commended, J. Broadie, Gorton, Manchester (Malays).

Ducks (Rouen).—First, T. Burn. Second, T. Statter. Third, T. Wakefield. Highly Commended, T. Burn; T. Bott; D. Hardie; J. H. Lasbrey; Uttoseter; E. Leech; J. Mann; J. Wood; T. Statter; T. Wakefield; J. J. Stott, Rochdale. *Draque.*—First, T. Statter. Second, J. Anderson. Third, E. Tadmur. Highly Commended, T. Burn, Abram, Wigan; T. Bott; E. Leech; J. Mann, Stocksteads; J. Wood; T. Wakefield, Golborne, Newton-le-Willows; J. J. Stott.

Ducks (White Aylesbury).—First, E. Leech. Second, E. Shaw. *Draque.*—First, D. Hardie. Second, E. Leech. Third, R. Smalley.

Ducks (East Indian, or Brown or White Call).—First, S. Burn, Whitby. Second, H. Beldon. Highly Commended, J. Wood; Rev. W. Serjeantson, Acton Burnell.

ORNAMENTAL WATERFOWL.—First, J. Ley, Bramley (Mandarins). Second and Third, J. Jennison (Cardinals and Pintails). Highly Commended, H. Mapplebeck (Cardinals); C. N. Baker, Chelsea (Mandarins and Cardinals); J. Jennison, Manchester (Bernacle Geese, Brent Geese, Tufted Divers, Mandarins, Shovelers); J. Ley (Shieldrakes and Cardinals). Commended, C. N. Baker (Pintails); J. Jennison (Shieldrakes and Summer Teal).

GESE (White).—First, T. Statter, jun. Second and Third, J. & W. Roston, Levenshulme. *Gander.*—First, T. Statter. Second, W. Wykes, Wolvey, Hinckley. Third, E. Leech. Highly Commended, W. Baxter, Waterfoot, Manchester.

GESE (Grey and Mottled).—First, S. H. Stott. Second, T. Statter, jun. Third, Rev. G. Huxley, Sellingfleet Vicarage, York. Highly Commended, T. Statter, jun.; W. Baxter. *Gander.*—First, S. H. Stott. Second, W. Baxter. Third, T. Statter, jun. Highly Commended, Rev. J. C. Macdonald, West Kirby.

CURLEYS.—*Cock.*—First, W. Wright, Tulbourne. Second, T. Statter. Third, W. S. Holden, Farnworth. Highly Commended, J. Chamberlain, Plumstead; E. Leech; W. Wykes. *Hens.*—First, W. S. Holden. Second, W. Wright. Third, E. Leech.

PIGEONS.

POUTERS (Blue or Red).—*Cocks.*—First and Silver Medal for the best Pouter Cock of any colour, R. Fulton, Leyford. Second, R. Fulton. Highly Commended, F. Crossley, Elland, Halifax. *Hens.*—First, A. Heath, Calne. Second, F. Crossley. Highly Commended, E. Horner, Harewood, Leeds; F. Crossley.

POUTERS (Any colour except Blue or Red).—*Cocks.*—First, W. Harvey, Sheffield. Second, R. Fulton. *Hens.*—First, Second, and Medal for the best Pouter Hen of any colour, R. Fulton.

CARRIERS (Black).—*Cocks.*—First and Medal for the best Carrier Cock of any colour, R. Fulton. Second, J. Chadwick, Bolton. Highly Commended, J. C. Ord, London. Commended, G. S. Hockey, Durham Down, Bristol. *Hens.*—First, R. Fulton. Second, F. Crossley. (Whole class Highly Commended).

CARRIERS (Dun).—*Cocks.*—First, J. Hawley, Bingley. Second, G. Charnley, Preston. Highly Commended, R. Fulton; T. Colley, Sheffield. *Hens.*—First and Medal for the best Carrier Hen of any colour, R. Fulton. Second, W. Harvey. Highly Commended, J. C. Ord; F. Crossley. Commended, G. Charnley.

CARRIERS (Any colour except Black or Dun).—*Cocks.*—First, T. Colley. Second, J. C. Ord. Highly Commended, J. C. Ord; F. Crossley. *Hens.*—First and Highly Commended, A. Lowe, Over Hulton, Bolton. Second, E. Fulton. Commended, G. Charnley.

DRAGONS (Yellow).—First and Second, C. Bulpin, Bridgewater. Highly Commended, J. W. Edge, Birmingham.

DRAGONS (Any other colour).—First, T. K. Crossley. Second, W. Harvey (Blue). Highly Commended, F. C. Bradley, Frodsham (Blue); J. W. Edge. Commended, E. Horner; A. Lowe (Blue).

ANTWERPS.—First, J. Hawley. Second, H. Yardley, Birmingham. Commended, R. Autherson, Hazel Grove, Stockport; J. Thompson, Bingley.

JACOBINS.—First, E. D. M. Ryds. Second, J. Hawley. Highly Commended, J. Hawley; E. Horner; J. B. Pinder, Harpurhey.

BABES.—First, G. Charnley. Second, R. Fulton. Highly Commended, J. Firth, jun., Dewsbury.

FANTAILS (White).—First, H. Yardley. Second, C. Bulpin. Highly Commended, W. H. Tomlinson, Newark; C. Bulpin; H. Draycott, Humberstone; J. W. Edge.

FANTAILS (Any colour except White).—First and Second, H. Yardley. Highly Commended, J. W. Edge.

TUMBLERS (Almond).—First and Second, R. Fulton. Highly Commended, J. Fielding, jun., Rochdale; F. Crossley; R. Fulton.

BEARDS OR BALDS.—First, J. Fielding, jun. Second, W. H. C. Oates, Berthorpe, Newark. Highly Commended, R. Fulton; J. Gooden, Hale, Atricham.

TUMBLERS (Any variety).—First, F. Crossley. Second, J. Fielding, jun. Highly Commended, R. Fulton.

NUNS.—First and Second, W. Dukes, Runcorn. Commended, C. Bulpin.

MAPIRES.—First and Highly Commended, E. Horner. Second, C. Bulpin.

TURBANS.—First, C. Bulpin. Second, E. Horner. Highly Commended, H. Mapplebeck, Birmingham; Capt. Mansell, Styal.

SWALLOWS.—First, E. Horner. Second, H. Draycott.

ARCHANGELS.—First, R. W. Edge. Third, C. Bulpin.

OWLS (Blue and Silver Euclyps).—First, J. Firth, jun. Second, Rev. F. Watson, Kelvedon. Highly Commended, J. Gooden; C. Bulpin. (Whole class Commended).

OWLS (Foreign).—First, J. Fielding, jun. Second, T. Crossley. Highly Commended, Countess of Derby, Knowsley; F. Crossley.

RUNTS.—First and Second, T. D. Green, Salford Warden. Highly Commended, H. Yardley; J. Firth, jun., Mount Street, London.

TRUMPETERS.—First, E. Horner. Second, J. Firth, jun. Highly Commended, W. Johnson; C. Bulpin.

ANY OTHER VARIETY NOT BEFORE MENTIONED.—First, J. Baily, jun. (Shield). Second and Third, H. Draycott (Frillbacks and Toys).

DOVES (Any variety).—First and Second, J. Jennison, Manchester (Barbary and Lace-neck).

JUGGES.—*Dorkings, Sparrows, Gulls, French Breeds, Extra Stock, and Bantams, except Game.* Mr. Edward Hewitt, Sparkbrook, Birmingham. *Brahmas, Game, Game Birds, &c.* Mr. R. Teckay,

Fulwood, Preston. *Hamburgs, Polands, Ducks, &c.*: Mr. James Dixon, North Park, Bradford. *Ornamental Water Fowl*: Messrs. Dixon, Hewitt, and Teabay. *Pigeons*: Mr. T. J. Cottle, Cheltenham; Mr. Esquilant, London.

THE SUNDERLAND WORKING MEN'S CLUB POULTRY SHOW.

THIS Exhibition took place December 19th, and for a first effort, considering the most arbitrary rules laid down for its government, was a most decided success; 120 pens were shown, and some very good birds might be seen in most classes. The *Bantams* were the great feature of the Show. The following is a list of the awards:—

GAME (Black Reds).—Prize, Buglass & Williamson, Durham.
GAME (Duckwings).—First and Second, Buglass & Williamson.
COCHINS (Any variety).—First and Second J. Carrick, Chester Lane, Sunderland.
HAMBURGS (Spangled).—First and Second, — Whitfield, Hetton-le-hole, Durham. Third, Buglass & Williamson.
HAMBURGS (Pencilled).—First and Second, — Whitfield.
POLANDS (Any variety).—Prize, — Whitfield.
GAME (Any variety).—*Cockerel*.—Prize, T. Dent, Sunderland. *Hens*.—First, Buglass & Williamson. Second, T. Dent. Third, J. Allen, Sunderland.
SPANISH (Any variety).—*Cockerel*.—Prize, H. Mitchell, Sunderland. *Cochin* (Any variety).—*Hen*.—First and Second, J. Carrick.
POLANDS (Any variety).—*Cockerel*.—First, J. Allen. *Hen*.—First, Second, and Third, J. Allen.
HAMBURGS (Cockerels).—First, — Whitfield. Second, J. Carrick. Third, Buglass & Williamson. *Hen*.—First and Second, — Whitfield. Third, — Ackroyd, Sunderland.
GAME BANTAMS (Black and other Reds).—First, T. Hunter, Sunderland. Second and Third, W. Dixon, Sunderland.
GAME BANTAMS (Duckwings and other Greys).—First, W. Dixon. Second, Wigham & Burrell. Third, J. Carrick.
GAME BANTAMS (Piles and Whites).—First, Buglass & Williamson. Second, W. Dixon. Third, — Ackroyd.
GAME BANTAMS (Rose-combed).—First and Third, C. Richardson. Second, W. Dixon. *Cock*.—First, W. Coulthard, Sunderland. *Hen*.—First, Second, and Third, W. Dixon.
BANTAMS (Any variety).—Prize, W. Clark, Sunderland.
GAME BANTAMS (Any variety).—*Cockerel*.—First, M. Watt, Deptford, Sunderland. Second, C. Richardson. Third, Wigham & Burrell. *Hen*.—First, — Ackroyd, Sunderland. Second, T. Hunter. Third, Wigham and Burrell.
BANTAMS (Sebrights).—Prize, — Ackroyd.
Mr. E. Hutton, Pudsey, Leeds, was the Judge.

JERSEY POULTRY SHOW.

(From a Correspondent.)

THIS Show was held in the Royal Hall, Peter Street, December 23rd and 24th. For the first show of the kind in the island it proved successful beyond the expectations of the originators, 176 pens of birds having been exhibited. The *Game, Cochins, Brahmas, Spanish, Houdans*, and *Bantam* classes were very creditable and numerous. The general arrangements for the Show were excellent in every respect. They were under the superintendence and by the advice of Miss E. Watts, who sent, not for competition, pens of Light and Dark Brahmas, as samples of what these should be. She was seconded by a most efficient and zealous Honorary Secretary, J. Voisin, Esq., assisted by an energetic Committee. The following is the list of prizes awarded:—

DORKINGS (Coloured, except Silver-Grey).—First, E. A. Neel. Second, Rev. W. Lempriere. *Chickens*.—Prize, — Iviny.
DORKINGS (Silver-Grey).—Prize, Col. Le Couteur, Q.A.D.C., Belle Vue. *Chickens*.—Prize, J. Voisin.
COCHIN-CHINA (Cinnamon and Buff).—Prize, Capt. Robin. *Chickens*.—First and Second, Capt. Robin. Highly Commended, — Le Rossignol.
COCHIN-CHINA (Brown and Partridge-feathered).—First, Capt. Robin. Second, E. Pond. *Chickens*.—First and Second, Capt. Robin. Highly Commended, Capt. Robin; — Le Rossignol. Commended, E. Pond.
COCHIN-CHINA (White).—Prize, Capt. Robin. *Chickens*.—First, Second, and Highly Commended, Capt. Robin.
BRAMA POOTRA (Dark).—First, Capt. Robin. Second, Capt. Howell. Highly Commended, S. R. Delme. *Chickens*.—First, J. Ercant, jun. Second, S. R. Delme. Highly Commended, W. Eckford. Commended, E. A. L'Oste.
BRAMA POOTRA (Light).—First, J. Voisin. Second, W. Bisson. *Chickens*.—First, E. A. L'Oste. Second, P. W. Le Quesne.
CREVE CŒUR.—First, Capt. Robin. Second, J. Le Rossignol. *Chickens*.—Prize, J. Ercant, jun.
HOUDANS.—First, Col. Le Gallais. Second, — Anwell. Highly Commended, Advocate Godfrey. *Chickens*.—First, Dr. King, sen. Second, J. Ercant, jun. Highly Commended, — Nicolle; H. Anwell.
LA FLÈCHE.—*Chickens*.—First, Col. Le Gallais. Second, — Blampied.
SPANISH.—First, Dr. King, jun. Second, Capt. Robin. *Chickens*.—First, Dr. King, jun. Second, J. De La Mare.
ANDALUSIANS (Blue).—Prize, J. Blampied.
HAMBURGS (Golden-pencilled).—Prize, Capt. Robin. *Chickens*.—First, Rev. H. Bateman. Second, Capt. Robin.
HAMBURGS (Silver-spangled).—*Chickens*.—Prize, G. De Faye.
POLISH (Golden).—Prize, R. Delme.
POLISH (Silver).—First, — Le Rossignol. Second, Rev. C. H. Bateman.
GAME (Black-breasted Red).—First, J. G. Falle. Second and Highly Commended, J. Voisin. *Chickens*.—First and Second, J. Voisin.
GAME (Brown and other Reds).—First and Second, J. Voisin. Highly Commended, J. G. Falle; J. Voisin. *Chickens*.—Prize, J. Voisin.

GAME (Duckwings and other Greys and Blues).—Prize, J. Voisin. Highly Commended, J. G. Falle. *Chickens*.—Prize, J. Voisin.
GAME (Black and Brassy-winged).—Prize, J. Voisin.
BANTAMS (Black, Clean-legged).—Prize, J. Voisin.
GAME (Black-breasted Red).—First, Capt. Howell. Second, J. Voisin. Highly Commended, E. Pond.
GAME BANTAMS (Any other variety).—First, J. Le Rossignol. Extra First, — Nicolle. Second, J. Voisin. Highly Commended, J. Voisin; Capt. Robin (Bredt). Highly Commended and Prize, Capt. Robin (White Crève-Cœur).
BARNDOOR OR ANY OTHER CROSSBREED.—First, P. Le Quesne. Second, — Pluck.
GUINEA FOWL.—First, — Le Rossignol. Second, P. De Gruchy.
DUCKS (White Aylesbury).—Prize, H. Le Peuvre.
DUCKS (Rouen).—First, G. Gibbs. Second, J. Voisin. Highly Commended, Col. Le Couteur, Q.A.D.C.
DUCKS (Call).—First, J. G. Falle. Extra First and Second, Rev. C. H. Bateman.
DUCKS (Widgeon and Carolina).—First and Second, J. G. Falle.
DUCKS (Muscovy).—First, Capt. Malzard. Second, — Dugdale.
DUCKS (Any variety).—Prize, Col. Le Couteur (Buenos Ayres). Highly Commended, J. G. Falle (Carolina).
GESE (White).—Prize, J. G. Falle (Sebastopol).
GESE (Grey or Mottled).—First, W. R. F. Godley. Second, E. A. L'Oste. *Gastings*.—Prize, — Dugdale. Highly Commended, E. A. L'Oste.
TURKEYS—Poults.—First and Second, E. A. L'Oste.
PIGEONS—Carriers.—Prize and Highly Commended, J. Voisin. *Pouters*.—First and Second, J. Voisin. *Fantails*.—Prize, J. Voisin. *Tumblers*.—Prize and Commended, J. Voisin. *Runts*.—Prize, Capt. Robin. *Any other Distinct Variety*.—First, — Nicolle. Second, — Marett. Highly Commended, J. Voisin.
GOLD AND SILVER PHEASANTS, OR ANY OTHER FANCY BIRDS.—First and Second, Mrs. Gray (Gold and Silver Pheasants). Extra First, J. G. Falle (Silver Pheasant). Highly Commended, Mrs. Gray (Australian Quail and Red Partridge); W. Gray (Grey Partridge). Commended, Mrs. Gray (Common Pheasant).
RABBITS—Himalayan.—Prize, — Le Marchand. *Any other Variety*.—Highly Commended, — Johnson.

The Judges were M. Gibaut, Esq., Mainland; J. Robin, Esq., Belvidere; Advocate Bertram, St. Lawrence; J. G. Falle, Esq., Mayor of St. Heliers; E. Denise, Esq., Mayor of St. Lawrence; J. Pond, Esq., The Vineries; Capt. Holt, Norfolk Lodge; W. R. F. Godley, Esq., Le Colombier; M. Ozier, St. Heliers; and M. Contanche.

HECKMONDWIKE POULTRY SHOW.

THIS took place on the 26th of December. The following is a list of the awards:—

SPANISH (Black).—First, W. Gregson, Dewsbury Moor. Second, J. W. Wilkinson, Bradford.
COCHIN-CHINA.—First, J. W. Wilkinson. Second, H. Firth.
BRAMA POOTRA.—First, W. Wilson, Liversedge. Second, J. W. Wilkinson.
GAME (Black-breasted).—First, W. Fell, Adwalton. Second, G. Noble, Staincliffe.
GAME (Brown Reds).—First, T. Suddick, Bradford. Second, H. Hatton, Cleckheaton.
GAME (Duckwings Grey and Blue).—First, J. Fell. Second, T. Robertshaw, jun., Ilkington.
GAME (Whites or Piles).—First, R. Turner, Drighlington. Second, H. C. J. Mason, Drighlington.
GAME (Black or Brassywings).—First, R. Walker, Wood Nook, Gomersal. Second, Cookson & Firth, Birkenshaw, near Leeds.
HAMBURGS (Gold and Silver-spangled).—First, W. Gregson. Second, J. W. Wilkinson.
HAMBURGS (Gold and Silver-pencilled).—First, W. Jagger, Horbury. Second, T. Swires, Cleckheaton.
HAMBURGS (Black).—Prize, H. Firth.
ANY OTHER VARIETY.—First, W. Gregson. Second, J. R. Walker, White Lee, Staincliffe.
SINGLE COCK (Any breed).—First, J. Fell. Second, T. Suddick. *Hen*.—First, T. Suddick. Second, W. Gregson.
GAME BANTAMS (Red).—First, S. Schofield. Second, W. Gregson.
GAME BANTAMS (Duckwing).—First, W. Gregson. Second, G. Noble.
BANTAMS (Black).—First, T. Parker, Heckmondwike. Second, L. Parker.
BANTAMS (White or any other variety).—First, W. Gregson. Second, J. Bions, Raistrick.
PIGEONS—Carriers.—Prize, H. O. Steel, Gomersal. *Antwerps*.—First, W. Gregson. Second, J. W. Wilkinson. *Tumblers*.—First, H. O. Steel. Second, A. Wilman, Dewsbury Moor. *Dragoons*.—First, W. Gregson. Second, H. O. Steel. *Turbits*.—First, J. W. Wilkinson. Second, J. Parker. *Fantails*.—First, J. W. Wilkinson. Second, J. Parker. *Common*.—First, J. W. Wilkinson. Second, J. W. Horsfield. *Any other Variety*.—First, A. Wilman. Second, J. W. Wilkinson.
JUDGE.—Mr. J. W. Thompson.

BRISTOL AND CLIFTON SHOW.—We are informed that for this Exhibition next week, there are 1089 entries of fowls, and 187 of Pigeons.

YEARLING PIGEONS.

As medals and money prizes are offered for competition at the Glasgow Show for birds bred during the year, I shall be glad to be informed through the medium of THE JOURNAL OF HORTICULTURE, whether a judge can decide that they are such, and by what distinguishing points they can be known? In the award of prizes to these classes, it seems to me that the first thing upon which to arrive at a conclusion, is (if it is

capable of a decision), whether they are birds of the season; or the object in giving the awards is frustrated. In the young Barb class, I hear from one exhibitor whose birds were noticed, that his were sixteen months at least, and that with the exception of two or three pairs, all had seen "the light of other days," than those of 1868, and were, as he describes it, "quite old enough to talk." One of the best judges of a Barb writes me, "that he is of the belief that there were not more than two pairs of Barbs shown at Glasgow, which were bred in 1868." "I can safely say," he adds, "I never had birds so developed at the age." And this from one who has bred some of the best specimens ever seen. One pen to my knowledge was well known last year.

I am not writing in order to blame exhibitors, as I know some who purchased birds to show, and believed that they were young. Those who send their specimens of the season's produce have not the slightest chance against these older, and, consequently, more developed competitors, and it is, in fact, simply a throwing away of the entry fees. The question is, Can a judge decide? For my own part, between the very early hatched birds of the year, and those late bred of the previous season, I would not attempt to do it, and I consider he would, indeed, be a clever judge who could. If, then, the question is an open one, there will always be exhibitors ready to take advantage, and so distance the real competitors of the year, and make the classes for young birds anything but satisfactory.—W. MASSEY, *Spalding*.

FROM WILTSHIRE TO GLASGOW, AND WHAT I SAW THERE.

PART 2.

At five o'clock a party of gentlemen, numbering between thirty and forty, sat down to dinner—it was the tenth annual dinner of the North British Columbarian Society. Oh! ye maligners of the fancy, who used to write, "This was a low neighbourhood, inhabited chiefly by dog fanciers, Pigeon fanciers, &c."—could ye, if ye yet survive (which I doubt), have looked in upon that company of gentlemen of education and position, ye would have apologised on the spot. It was a kindly gathering, and the dinner and dinner-table decorations were admirable. Never was Her Majesty's health drunk more loyally, nor more of heart entered into toasts and speeches. Jacobite songs (how long a sentiment outlives a principle!) reminded me that I was in the country of the Preten—no, of Prince Charles Edward. "Our Journal" was honoured by the way in which its representative was received, showing that the organ of the fancy was well loved by northern fanciers. One particular and very pleasing event of the evening was the presentation of a magnificent epergne, palm-tree-shaped, to the Treasurer of the Society, Mr. Wallace, by his brother members.

At length, all toasts being over, from that of the first Lady of the land to the ladies she rules, we adjourned to the Trades' Hall for a private gaslight view of the Show. I soon find myself in a fair-sized hall filled with Pigeon pens, and am proceeding to examine the birds, when I am told that this is not the Show, but merely its appendix. Led on further, I enter a grandly proportioned room, 70 feet long by 33 wide, and this hall is also as full as possible of Pigeon pens. Around the walls and in the windows are pens closely placed. Across the Hall are long tables, and lines of pens back to back on each table, with gangways just sufficiently wide to walk down. The pens are bee-hive-shaped and all wire, so that no heavy wooden backs hinder the view, which was imposing from the number of birds, and pleasing from the lightness of the pens, each with its feathered inhabitants. The total number of pens in both halls was 584. Such a number of birds had never before been brought together even at this the Birmingham of Pigeon shows. This was partly accounted for because the "members' challenge cup," value £30, was this year to be finally awarded. For the possession of this treasure there was a close competition between Mr. James Montgomery, the President of the Society, and Mr. Fulton, of Deptford, the well known dealer and exhibitor. Mr. Montgomery showed 160 pens, Mr. Fulton 143 pens. The former gentleman was successful. The cup, designed by the Committee, and manufactured by Muirhead, of Edinburgh, was urn-shaped, with a cover, on which was a Pouter in frosted silver. The cup was placed on a stand, at each corner of which was a Tumbler, a Carrier, a Jacobin, and a Fantail matching the above-named Pouter.

To return to the birds themselves. We have in England

been long aware that the Pouter is the especial favourite of the Scotch fanciers, hence it was no surprise to find that the show of Pouters was a large one; but they outdid my anticipations. They numbered 291 pens—just about one-half of the whole. I would say, let dreamers of the surpassing beauty of the birds of former years go to Glasgow, and they will confess that the present beats the past. If you dream of Black Pied Pouters of raven blackness, there they are alive; if of Dark Reds and rich Yellows, there they are alive. If you dream of perfectly marked Blues, there they are; if of perfection of shape, there it is; if of size, there it is, for the Glasgow birds were gigantic. There was another point connected with this Show, there was scarcely one bad pen—those bad pens which show that the exhibitors are ignorant of what a good bird is. There were a few small pretty birds here and there, and some large but not graceful birds; but the rule was large and good, and the prize birds were super-excellent. I was once looking at a remarkably ugly white bull at a large agricultural show, and I heard his owner asked by a rough wit why he brought it there. He replied, "To get a prize." "Oh!" was the answer, "I thought you brought it to be laughed at." Now such exhibition stock was not in the Trades' Hall, Glasgow. The Black Pied birds bred this year were abundant and good. I would notice Mr. Fulton's first-prize. Then beautifully slender were his first-prize Whites. The first-prize Blues, Mr. Montgomery's, were birds which I hovered round, and went back to again and again. As to the prize Reds and Yellows, they were colours of the deepest and richest kind; and the Mealy had the grace of shape, though, of course, lacking the beauty of colour. Among so many and such good birds it is difficult to particularise, but I cannot omit a word of praise to the colour and size of Mr. Montgomery's three prize pens of Red Pied cocks: the colour was grand. For the Pouters "irregular in colour and marking"—the North British Columbarian Society is wonderfully kind to Pouters of all colours—I own I cared much less. Chequers, Sandies, Splashes, &c., are useful but not ornamental. The hen Pouters deserve all the praise bestowed on the cocks. To the Pouters my first visit was naturally enough made. Indeed, my gaslight view was a ramble of wonder, half pitying, however, the poor birds suddenly awake from their first sleep. Next morning I took a general view; then I paid a patient and particular visit to every pen in rotation; and on Friday wandered here and there, examining and delighting over the best specimens.

Next to the Pouters in number and excellence came the Carriers. Of these there were ninety-three pens, among them some of the finest or most promising birds ever seen. As is usual, the Blacks were the best.

Passing on from the Carriers, those tender, frail, greenhouse darlings, the Short-faced Tumblers, claim my attention—twenty-three pens. These were most beautiful. I held in my hand an Almond cock of perfect feather, tail well marked, hackle rich, head and beak charming. But perhaps the very gem of the Short-faced were Mr. Fulton's first-prize Black Mottles. But I pass on to the Barbs, which occupied one corner to themselves, and made that corner glitter with their rich purple metallic hues. Of them there were twenty-nine pens—a beautiful class, and beautiful specimens of this high-class variety of the fancy Pigeon. Mr. Frame exhibited a pen of seven young Barbs of various colours as extra stock, and not for competition, which when shown for a prize must have extra good birds to beat them.

The Fantails numbered eighteen pens. Our Scotch friends excel in Fans; I saw some at Mr. Huie's, of wonderful motion and carriage, real Broad-tailed Shakers. They have also a breed of Saddle-back Fans, which are striking and very pretty.

But to the Show. Jacobins, then Trumpeters—among them the most wonderful bird known, the Black cock in Mr. Montgomery's first-prize pen; Turbits, those soft-feathered bits of loveliness; English and foreign Owls, the latter to the former what the Short-faced Tumblers are to the commoner birds; Dragons and Nuns, not numerous; Beards and Balds—I preferred the second-prize Red Balds; and then, last of all, "Fancy Pigeons not otherwise classed," chiefly pretty-feathered or quaint-looking German Toys. Not a single pen of Runts, which I regretted, and no prize for Antwerps. The Scotch fanciers use them as nurses, but say that they see nothing in them to entitle them to a place at an exhibition.

Some large sales were effected in the Hall, one large bird selling for £20, and a pair of young ones for £14. It would be well if exhibitors who do not at the last moment send their birds would put a note to that effect in the pens of the birds

they do send, or would send a letter or telegram. This would save committees a world of trouble and anxiety, who send again and again to the station, and are full of fear lest the missing birds are really lost. Now, a notice sent that they were not to be expected would save all this trouble. The judging, considering the number judged and the darkness of a short December day, to say nothing of one Judge not arriving, was excellent, and gave satisfaction.

As I frequently turned to look at this beautiful show of beautiful birds, filling a large hall and a large room, I could not but regret that more visitors were not present. I know one reason is, that one must be a fancier to properly esteem birds of fancy—the eye must be educated in order to appreciate. Yet feathered beauty ought itself to draw crowds, and people so drawn learn to love and enjoy. For this reason I, in my humble capacity, endeavour to write as to bring the fancy to the public, in order (and it is being done gradually), to bring the public to the fancy. Dry details are not generally read, but a light general sketch is read. Every man needs a hobby, the more needed as the life of man becomes busier and more full of care. Modern life draws hard upon the brain. Now, here is a hobby free from every possible vice, never exhausted, always something fresh to learn, and which also promotes kindness, and brings men of different ranks and opinions harmoniously together, and so, in fact, makes the world better. People who have exchanged kind words about a mutual fancy will not break each other's heads at an election, or become fierce and fiery-eyed over a religious controversy. For my own part I greatly enjoyed the company both of the birds and their owners. I beg to put in print my best thanks to the Committee of the North British Columbarian Society for their kind invitation. Faces are now known to me instead of mere names. It did not rain in Glasgow—yes, it did; it rained kindness. I beg to thank my Scotch friends for their public welcome and their private hospitality. To several houses I was taken; to others I was to have gone had time allowed. Often in a mood of afterthought, in the dusk hour, the gloaming, shall I think over all I saw in Glasgow. 'Tis pleasant to add to one's list of friends those who have kindred tastes. "Let Glasgow Flourish" is that city's motto. I would add to it, "Let the North British Columbarian Society flourish." It is a great advantage to the fancy to have in it gentlemen of spirit, and taste, and means. As to the fancy itself, that must be a good one which makes eyes look kind and hands meet warmly—that causes a kindly welcome and a regretful parting.

And now I will conclude with the prettiest Pigeon anecdote I ever heard. My Scotch host told me that once, wanting a particular variety of Pigeon, he heard where he could procure one. He found a very humble home, but a tidy, middle-aged motherly woman. The birds were kept in a little pantry opening into the living-room. He was bidden to wait a few minutes, as the owners, the woman's two sons, would soon be home from the foundry. A neighbour in passing noticed the woman sweeping up some sand which had blown into the room from the Pigeon place, and said, "I wonder, mistress, ye bother with they does" (Pigeons). "Aye," replied she, "no bother to me, for they bring the laddies sune hame at night." No sooner said than the laddies came in, two stalwart grimy sons of the forge, who preferred their birds to the public-house or the idle corner. Yes, to enjoy them "the laddies came sune hame at night."—WILTSHIRE RECTOR.

RABBIT JUDGING AT THE LEEDS SHOW.

BEING one of the largest exhibitors of fancy Rabbits in England, and having suffered through incompetent judges being employed at many shows—Hull, Bingley, &c., I think I may venture to say, and my brother exhibitors will agree with me, that the Rabbit-judging at Leeds this year beats all we ever experienced or heard of.

Just allow me to make a remark upon one or two classes, and I may add that in each class there were a good many entries, and that they contained amongst them some of the very best Rabbits in England. In the class for the best Yellow and White, the first prize was awarded to a Rabbit that for colour could not be worse marked. Imagine a yellow Rabbit well splashed with a whiting brush and you will arrive at my meaning, and Rabbits in the same class, unnoticed, perfectly marked, an inch longer in the ears, and perfect in all other points. For the best Black and White, the second-prize Rabbit was (can it be believed?) not lop-eared but oar-lopped, and

dreadfully so, a bad black and white, not at all well marked; ears not more than 19 inches; and those unnoticed were beautiful perfect specimens for colour and quality. The next class, which had twenty-two entries, is the last one I shall notice—the best Self-coloured Rabbit, all properties—and this crowns the rest for bad judging. The first prize was given to a young Blue doe, 21 inches in length, bred by the exhibitor, which came in second at York for the working men's prize—a poor Rabbit in all properties. And what were those left in the rear? Some of the very best Rabbits known, with ears from 22 to 23½ inches long, perfect in all points, form, eye, and colour. The decision arrived at by the Judge needs no comment of mine, it speaks for itself.

What I want to show is, that if societies offer prizes for Rabbits, and would give general satisfaction, they cannot be too careful to see and select competent judges, such as Mr. Hewitt, Mr. Teebay, or Mr. Fletcher, of Hull, men whose names are above suspicion, and who cannot be influenced one way or the other. If such judging as we have seen at Leeds be allowed quietly to go by unnoticed, the respectable portion of the fancy will be disgusted.—ONE OF THE FANCY.

NEW BOOK.

The Naturalist's Note Book for 1868. London: Reeves and Turner.

This is an "Annual Register" of facts noticed or occurring during the year in the various departments of natural science; and numerous and interesting is the concentration in its pages of subjects relating to Astronomy, Meteorology, Botany, Ethnology, Geography, Geology, Microscopy, Zoology, Chemistry, &c. It is a volume useful for reference to the scientist, and for leading the youthful into the paths of science. We will make one extract, not only because appropriate to our pages, but because we can testify to the success of the practice.

"I have for some time kept a fine pair of 'Leperroys,' a French breed of the large tame Grey Rabbits. I adopted the German mode of keeping them—viz., I converted a rubbish heap in my garden into a sloping bank. I laid a foundation of bricks (about two dozen), which I placed on the ground in four rows of threes, and on these I fixed my hutch, made of an 'egg-chest,' hought of a pork and egg merchant for 3s. 6d. The rubbish heap was in a corner of my garden. I levelled it at the top, and enclosed it with wire netting at 3d. per yard, cut a hole in the back of the hutch, and jammed it up against the end of the bank—wire netting for Hares—enclosing bank and side of hutch, into which I placed a pair of 'Leperroys' (a cross between Flare and wild Rabbit originally), who in a few days worked their way out of the hole in the back of the hutch into the back of the bank, and made a hole, through which they came on to the top of the bank. Here they used to feed on the food I threw on to the bank daily over the top of the netting. After a time these Rabbits burrowed into the bank again from a hole they made in the angle of the wall, which composed two sides of their bank, and burrowed under the whole bank in a straight line back into their hutch. I have now had three litters of young ones, and my object in writing this letter is to say that the idea that the buck Rabbit will devour his young if left with the doe during the time of her littering is fallacious. The first litter my doe had I took the buck from her; the second and third time I left him on the bank. The doe was so fierce he dared not so much as put his nose inside the burrow in which she had made her nest and deposited her young, and the doe keeps him on the top of the bank until the young Rabbits are six weeks old. Then, and only then, does the doe allow him to enter the burrow, and she again lives with him.

"I have now about twelve or thirteen young Rabbits; my doe is about nine months old. She had two young ones only in her first litter, six in her second, and eight in her third. Several of the little ones have been roasted for dinner, and she is now again making her nest. The buck never attempts to kill his offspring; so if any of your readers wish to keep Rabbits let them adopt my plan, instead of keeping a lot of miserable captives in solitary confinement in dirty bad-smelling hutches. Let the male and female dwell together always on a bank, in unity, as they do in nature; feed them well with vegetables and weeds from the garden, all of which, even nettles, they greedily devour, with a feed of carrots and corn mixed with bran once daily, and they will find they will increase faster than they wish even. At six or eight weeks old I put the young ones on another and similar bank, away from their parents, and thus fatten them up for sale or for our own table. Every six weeks my doe has a litter, and the young ones make their appearance on the top of the bank about twenty-eight days after I have supplied the doe with hay and leaves, with which she makes her nest, either inside the hutch (over the front of which I always have a waterproof curtain), or in the burrows they have themselves made in several different places on the bank, which is about 10 feet square, and 3 or 4 feet high."

It is a mistake stating that the Leperroys are a hybrid be-

tween the Hare and wild Rabbit. They are merely a large variety of the Rabbit, with fur resembling slightly in colour that of the Hare. We know an instance where white Rabbits, which are much less hardy, were kept successfully in a similar manner.

JERSEY—ITS LIVE STOCK.

(Concluded from page 434.)

From the geniality of its climate, poultry should be as much a speciality in Jersey as its cows, yet not only is the island a nonentity in the furnishing of other markets, but it draws its own supply chiefly from France. The general quality of the poultry in the market is only passable, but even this degree of merit has sprung into existence within a few years. It is more than twenty-five years since I visited Jersey for the first time, and then the poultry in the market was poor indeed. The markets themselves were very indifferent compared with what they are now, and the poultry supply mainly consisted of a few diminutive, common, ugly live chickens lying before the market women with their legs tied. These were bought by purchasers and carried home to be killed. Ducks were treated in the same manner. A large Goose was a bird not to be met with. Prices were then low, chickens being about 1s. each, and other poultry in proportion. A dead poultry market was an after-improvement, but now that prices have increased to 2s. 6d. for fowls, and 4s. or 5s. each for Geese, their merit has not advanced in the same proportion. The amateur's fancy for choice poultry has advanced more than the merit in the dead stock. Good fowls of fine sorts are met with rather frequently, and the French breeds are kept by some, but do not appear to be maintained with great distinctness. On the whole the progress of Jersey in poultry-rearing and in the poultry fancy is not commensurate with that of less happily situated localities in England, for it is gifted with a climate and position which ought to render it a valuable depot for live and dead fowls of all kinds. Early chickens thrive well. The island's foundation of rock, and the light soil, render most localities so warm and dry that the injurious effects on chickens, of the cold damp of our English springs, are little felt by Jersey early chickens. Spring chickens for the London market might easily be reared while the price yet continues high, and delicate kinds of fancy fowls might be raised with much less difficulty than in England.

Hitherto, Jersey has not had the spur of a poultry show, for the small addition of a few pens of fowls to the horticultural exhibitions has been too poorly supported to do much good, or to give much impetus to the movement. Now however, there is an effort made which I hope will tend to place poultry on its proper footing in Jersey. A Poultry Society has been inaugurated, and its first poultry show took place on the 23rd and 24th of December. How many places there are in England which may date the benefit arising to rich and poor from a good development of their poultry resources, to the early efforts of a well-managed poultry society! The rich have from it recreation, gratification, and occupation, whilst those who are not gifted with affluence can realise from their leisure hours only, and their children's healthful, non-onerous work, comforts otherwise beyond their means. I hope to see such good results happen in Jersey, and to witness the resources of the island augmented by the abundant rearing of choice and early fowls. The Poultry Society and its poultry show will, no doubt, create an increased love of poultry, and increasing trade in it, to the great benefit of the island's prosperity.

A dog show accompanied the poultry show. A pointer or a pretty spaniel may be seen on rare occasions. There are a few greyhounds about, and also some pretty ladies' dogs, but the dogs, like the poultry, may improve by the aid of the show. A dog tax has lately been introduced in Jersey, formerly so lauded as free of taxation, and this has decidedly decreased the canine inhabitants in number; however, it may act on quality, for perhaps some may think they may as well pay the half-crown for a good-looking dog as for an ugly cur. A peculiar race of large, yellow, brown, rough-haired dogs, which used to frequent the market years ago, has disappeared.

In speaking of Jersey live stock, the goats should scarcely be passed over in silence, for they used to be so numerous on all the hillsides and scraps of waste land, and along the hedgerows, wherever a bit of poor pasture could be found that it seemed that every poor family at least must keep its goat. Rough goats of the common sort, they were generally tethered,

and much teased by the boys, but numerous enough to be very ornamental in the landscape, feeding on the hillsides.—E. W., Jersey.

LARGE HIVES.

The remarks made by your correspondent Mr. A. Pettigrew are so peculiar, as condemning the very best hives in use, and upholding the one that he and his father have imagined to be the best, whilst he misconstrues several sentences in my review of his last letter, that for the benefit of the readers of "our Journal," I will endeavour to lay the facts before them.

Perhaps Mr. Pettigrew will explain what he means by giving the reader a correct idea by contrasting the Stewarton hive with his large hives. Not only is the Stewarton hive the best honey-producing, but it is the largest, hive in the world. Where he condemns anonymous writing, or letters with fictitious signatures, I also beg to differ from him. I regret to say that it is too much the case, that more regard is paid to persons than to talent; and this I am bound to say, that people judge the best when they are ignorant of the names of the owners of the property judged. I beg also to state that I have neither tried to mislead, nor have I misled those "not remarkable for close and accurate thinking." I have not published my experience in bravado, but by stating facts and details of a long experience I have endeavoured to guide aright those who may require it, allowing my pupils to be my judges. I feel, moreover, perfectly satisfied, that although the commendations bestowed on big stock hives may mislead a few, these will very soon be confounded like a swarm which has lost its queen, and will in the long run return to my directions, and will then rejoice as a swarm which has found its queen.

Will Mr. Pettigrew point out any statements which I have made that I cannot substantiate? I can, indeed, make good everything that I have stated, and far more. He asks, How do I know that "large hives in the spring months are comparatively small in population, and without sufficient warmth to hatch the brood?" These are not my words. I said the bees were few in comparison to the size of the hive, and this I know by experience. I can assure him that he is not the only one who has used large hives, of which the disadvantages are many. First, a newly-hived swarm does not build combs so fast as when put into a smaller hive which is capable of being enlarged. Then the bees are more apt to fabricate drone combs, whilst in many seasons they are unable to store food enough for the winter in consequence of having so much comb to build, and when they have made honey and deprivation takes place, much valuable comb is lost or destroyed. During winter the bees are sometimes located at a distance from their honey, and consequently many die from that cause; then in the spring a swarm cannot, as a rule, cover nearly the whole of the combs, in consequence of which moths and other vermin gain access to the hive and destroy much of its contents; the bees, also, are unable to maintain the same degree of heat as when they are located in a smaller hive, and many eggs laid by the queen are lost on that account. These are some of the disadvantages of large stock hives, which are all obviated in the Stewarton hive.

If, instead of my satisfying Mr. Pettigrew, he will satisfy himself as to the quantity of eggs a Stewarton hive can contain, he will, perhaps, be convinced, and I would ask him why he questions that which he will not put himself to the trouble of ascertaining? If he will do so, he will then see that I have neither gone beyond the bounds of possibility nor of reason and if he will cast aside prejudice and submit to be taught, he will find that Stewarton hives are both swarming and non-swarming. If, also, he will peruse my former letters, he will there find some valuable information with regard to the management of bees both on the swarming and on the non-swarming systems. Again, I did not say that three thousand eggs were laid and hatched daily, I only said there was accommodation for that number, showing that there was room for more eggs in a hive of the dimensions which I stated than were allowed even by Mr. Pettigrew to be laid daily; and had he appeared desirous of learning, I would have stated the exact number of eggs laid, together with those hatched, in a hive from March till July, showing the average deaths for every day, thus giving to the bee-keeper a precise knowledge of what size a hive ought to be for every day in the year. Mr. Pettigrew's method of keeping a number of hives one year in order to strengthen them the next is extravagant bee-keeping, which must result in loss, and I am quite sure that bee-keepers

following his plan will have reason to regret it. I am also certain that had Mr. Pettigrew visited Glasgow, the great *dépôt* for first-class honeycomb, and there seen many of what we term second-class honey-boxes, to say nothing of first-class ones, he never would have mentioned that which was hawked about in Manchester and taken from large stock hives. I do not speak this at haphazard, having had ocular demonstration, and having also Carlisle honey in my possession, I am quite able to judge of its quality.

I do not believe language can be too strong when nothing but facts are stated, but when it is apt to convey to the mind of the reader an extravagant view of the case, a little policy may be used, but polite letters not showing the truth are worse than strong language, and in these my words I have not gone beyond bounds. Other countries may, doubtless, produce more honey, but taking climate and pasturage into consideration, no hive has beaten the Stewarton, and I have only to appeal to the majority of intelligent bee-keepers, both on this as well as on the other side of the Atlantic, who I am certain will corroborate my statements. It would, indeed, be a matter of regret if such a number of us have laboured so long with improved hives, groping in the dark and being entirely wrong, as Mr. Pettigrew will have it, when one individual only has the right way, and his plan being one of the most primitive. I cannot either believe that drained honey is more in demand than honeycomb; for my part I can sell 1 cwt. of comb for every pint of honey, although as regards my own taste, I prefer drained honey to that in the comb, and believe the majority of the upper classes are of the same opinion; but as they cannot depend on drained honey being perfectly clean, they all prefer to purchase comb and drain it themselves, thereby obtaining the purest honey whilst reserving the finest comb for the table.

None will be more happy to receive Mr. Pettigrew than myself, whenever he may think fit to pay me a visit; but as time works changes and wonders, and as I never count on tomorrow, I do not now give my address, but when he is about to visit Lanarkshire, he can have my address from the office of THE JOURNAL OF HORTICULTURE. But I may here say, that my apiary is continually undergoing changes, and I cannot in the meantime tell whether he will find it in a state of honey-making or of experimentalising. I regret also to say that Lanarkshire is far behind in bee-keeping, and he may not, therefore, find anything very extraordinary. I will, however, most gladly accompany him to Ayrshire, where he will, perhaps, see bee-keeping as it ought to be, and where probably our Renfrewshire friend will give a welcome reception to Mr. Pettigrew as well as to—A LANARKSHIRE BEE-KEEPER.

SUPPOSED STRANGE PHENOMENON IN THE BEE.

THE time is fast approaching when bees emit their annual midnight sounding, therefore I beg to remind those who are curious on the subject that this singular phenomenon was noticed for generations by our ancestors, and said by them to take place at twelve o'clock at night on Old Christmas Eve. Now, for some years back the annual listening to bees seems to have been abandoned, but why I cannot say; for, when a boy, there were three or four old people who could say they had heard the bees on Old Christmas Eve, yet all old people in this neighbourhood persisted that the ox prayed, the ass brayed, and the bees sung at twelve o'clock on Old Christmas Eve. The bees I have thoroughly investigated, and find that they emit a solemn, harmonious sound at twelve o'clock at night on the 6th of January. Here is a discrepancy betwixt the bees and the almanacks, for the almanacks give January 5th as Old Christmas Eve. To satisfy myself on that point, I turned to the word "Chronology" in the "Encyclopædia Britannica," which shows that Pope Gregory XIII., in the year 1582, ordered the 4th of October to be made the 15th of October, and that every fourth century was to be a leap year, and the three intervening centuries were not to finish with a leap year; then the year 1600 was made a leap year, and the years 1700 and 1800 were not leap years, thus putting the new calendar two days farther back from the old, which, with the former eleven days, make in all thirteen days difference between the old and new system. Now from the 24th of December, or new Christmas, we turn the hand of time onward thirteen days, and you will find that the old falls on January 6th, the night on which bees keep an anniversary, but from what cause I cannot say; still the fact that bees do sound annually as

stated above, is easily solved by attending at the proper time.—GEO. WILSON, *Whalton*.

[We gave what appears to us the most probable explanation of this supposed phenomenon when the subject was first mooted in our number of the 27th February in the present year.]

OUR LETTER BOX.

FOWLS PLUCKING EACH OTHER (J. P. H.).—If your fowls are kept in confinement (and we have never known fowls at liberty eat their fathers), you must watch the offender and remove him or her. Feed all the birds moderately with cooling food. Give green meat, especially lettuce, and let them have plenty of fresh earth. You cannot expect to buy all prize birds, but if you deal with respectable people you should have very good birds.

PEAS AS FOOD FOR POULTRY AND PIGEONS (R. R.).—The digestion of Pigeons is twice as quick as that of any other of the poultry tribes. They are birds of feather, and peas are good for plumage; for this purpose they are given to Game cocks to harden feather. Their property is to harden flesh and feather, and this is not desirable for food. They also stop growth. If you will give good, sound, ground oats and barley, you will want no other food. Your egg produce is very good and speaks well for your feeding.

TUMOUR ON HOUDAN'S EYE (Houdan).—Remove it with sharp scissors, and apply caustic to the wound.

DUCKS (Peruvian, Sheffield).—The Muscovy Ducks will not snit, either light or dark ones. They are strong, and their eggs are strong. They become very heavy, but not so heavy as you name. They are not a profitable breed. If these were their only faults they might be overlooked, but the habits of the drake are so filthy he is unfit to be snuffed at large anywhere. You will probably find a thorn or a small stone in the foot of your Duck, having perforated the skin. Remove it and she will be well.

GUILDFORD POULTRY SHOW.—We are informed that the Rev. Dr. Merriam obtained the first prize for Aylesbury Ducks.

FATTENING POULTRY (N. P.).—The oatmeal without the mashed potatoes, and made into a stiff paste with milk or the water meat has been boiled in, will do.

COCHIN-CHINA COCK LAME (J. W.).—We answered the query last week. To detect the causes of morbid affections is difficult without full particulars.

PIGEONS SITTING IN WINTER (Pigeon).—Let your birds go on where they are and as they please, only feed them extra well. You may have good luck, save in the case of very tender varieties, such as African Owls and Almond Tumblers, &c. "A hot room" is not a natural, and therefore not a suitable place for Pigeons.

RATS IN A PIGEON HOUSE (Rats).—Shut up your birds at night and feed the rats three nights in succession on a banquet of bread and butter. Their suspicions being thus lulled, on the fourth put a little arsenic with the butter, and you will destroy them all.

MOVEABLE COMB HIVES (Sudbury).—We are still of opinion that the discussion of the question, "Are deckbrettchen (deckbrettchen are thin ships of wood laid on the tops of either bars or frames, and are, so far as we are aware, entirely unknown in England), necessary or unnecessary in Dzierzon hives, or are they altogether objectionable?" possesses but little interest for English readers. With regard to that which you appear desirous of raising, but to which we made no allusion whatever, we may remark, that however justly Major Munn may claim that his three-cornered frames preceded the rectangular ones of Langstroth and Von Berlepsch, he can make no complaint on this score against Dzierzon, who eschews frames altogether.

FOUL BROOD (G. A.).—None of the contents of the infected hive should be given to other bees. If thoroughly scraped over and disinfected with chloride of lime, the hive may probably be used with impunity next season, although we should prefer laying it by for another year.

BEES RESTLESS IN WINTER (H.).—We do not think the restlessness of the bees, and their being outside the hive in all weathers, likely to be caused by hunger, and doubt whether anything you can now do would not make matters worse instead of improving them. Still, if it be evident that something is very much amiss, we might ourselves prefer risk to suspense, and should in this case avail ourselves of the first fine mild day to lift out the combs, and make a thorough examination, with the view of ascertaining what is wrong, and applying a remedy. Should food be imperatively required, it must, at any rate, be administered where they are.

BEES NEAR A MANUFACTURING TOWN (Black Donald).—If we lived in a similar situation we should not be deterred from giving bees a trial, and if none are kept by the neighbours, your bees will have the better chance. If instead of a swarm your friend will send you a stock with combs a year or two old, it will travel safely from the Land's End to John o' Groat's if sent early in March and packed in the following manner:—Tie the hive up in cheesecloth, and guard against the bees escaping by passing a cord tightly twice round it about 2 inches from the bottom edge. Next invert it, and pack it securely in this position with either hay or straw in a tea chest of appropriate size, and of sufficient depth to leave an inch or two clear space above the hive, which should be kept from moving by a strip of wood passing across it and nailed to the sides of the box. Next bore half-a-dozen holes with an inch bit in the lid, which should then be nailed on, marked—"This side up," and the package, after being well corded, may be safely sent to any part of the kingdom, or indeed to any part of Europe.

CANARY-KEEPING (A. B.).—We cannot find space for all the details of management. If you enclose twenty postage stamps with your address, and order Brent's "Canary and British Finches," it will be sent to you free by post from our office. It contains full details. The fire tree in your aviary will be beneficial rather than the contrary.

GOLD FISH (Idem).—We know a successful keeper of these who gives them raw meat cut fine—a very little, almost daily. The tank should have sand at the bottom, and might have nearly all the water taken out without removing the fish. Hauling them is bad practice.
